PREFACE

A major four-year weed survey project titled “Shifts in the Distribution, Abundance, Resistance, and Management of Weeds in Prairie Ecosystems” was initiated in 2001. The project has three equally important components. The field survey component involves weed counts in 4000 randomly selected sites in Alberta, Saskatchewan and Manitoba. The second project component includes a management questionnaire that is used to gather details of the farm practices used on the 4000 surveyed fields. Dr. Hugh Beckie is the coordinator for the third project component that involves a survey for resistant weeds in 800 fields randomly selected from the list of surveyed sites.

Each of the Prairie Provinces was surveyed first in the 1970's and again in the 1980's and 1990's. The 2003 Saskatchewan survey reported in this publication is part of the fourth survey in the series. Alberta was surveyed in 2001 and Manitoba in 2002. After completion of the Saskatchewan field survey, Saskatchewan Agriculture, Food and Rural Revitalization collected information on the management history of the surveyed fields using a questionnaire. The summarization of the questionnaire data is an important aspect of the overall project and will be the subject of a separate report in the future. A detailed analysis of the correlations between weed communities and management practices will also be the subject of future publications.

The weed community database, compiled from periodic surveys in Saskatchewan, now contains information on the density of more than 150 weed species in approximately 8800 fields of cereal, oilseed and pulse crops. This is the only source of independent quantitative data on weed populations for these crops in Saskatchewan. The size and time span of the database make it unique and valuable for tracking shifts in weed populations.

This report is part of a Weed Survey Series that presents the information accumulated during the past 28 years of weed survey projects in Canada. The purpose of these reports is to provide quick summaries of the results in tables and maps. The published reports to date have dealt with cereal and oilseed crops in Prince Edward Island, Manitoba, Saskatchewan, Alberta, and the Peace River Region of British Columbia. Reports from southern Ontario included the row crops, corn, soybean, tomato and cereal crops. Weeds of forage crops in the Peace River Region of British Columbia and weeds of fields where alfalfa was grown for seed in Manitoba were also the subjects of reports in this series. Some publications in this series reported on surveys of sunflower, mustard, lentil, field pea, and winter wheat in Saskatchewan. Comparisons among the weed populations under different tillage systems in southwestern Ontario and in Manitoba were published. All these surveys have used a similar method of summarization that enables the results from across Canada and from different years to be assessed in the same way.

I hope that you will find the survey results contained in this report a useful addition to our knowledge of the distribution and abundance of weeds in Saskatchewan. It is my goal to provide these data in a timely manner and in a convenient format. I encourage you to take the time to delve into the details contained in this report and hope it will provide answers to some of your specific questions. Your suggestions and comments on the content and style of the presentation are always appreciated.

ACKNOWLEDGEMENTS

Financial Support

Direct financial assistance to conduct the survey was provided by:

Matching Investment Initiative (MII) of Agriculture and Agri-Food Canada
and by the following herbicide manufacturers and distributors:

Arvesta Canada
Aventis Crop Science Canada Co.
BASF Canada
Bayer Inc.
Dow AgroSciences Canada Inc.
Dupont Canada Inc.
Monsanto Canada Inc.
Nufarm Agriculture Inc.
Western Co-operative Fertilizers Limited.

In-Kind Support

The 2003 weed survey in major cereal, oilseed and pulse crops in Saskatchewan was a product of the hard work, support, and encouragement of many people. The project was a collaborative endeavour of Saskatchewan Agriculture, Food and Rural Revitalization and Agriculture and Agri-Food Canada (AAFC). More than 75 people from these organizations contributed to the project.

We would like to thank all the Saskatchewan Agriculture, Food and Rural Revitalization staff from the Crop Development, Administration and Extension Branches who helped with the weed survey. The following names and office locations are those of Saskatchewan Agriculture Food and Rural Revitalization staff who contacted producers on the telephone to recruit their participation in the study.

Assiniboia	Shirley Pickard Suzanne Waiting	Nipawin	Sylvia Kuhberg Louise Newstead
Biggar	Jean Itterman	North Battleford	Kathy Knisely
Canora	Marlene Comeault	Outlook	Marina Matlock
Carnduff	Patricia Sidey	Prince Albert	Elaine Tompkins

Meadow Lake	Donna Lowe	Watrous	Barb Beck
Moose Jaw	Colleen Seaman	Weyburn	Gloria Berry
Moosomin	Donna Raab Lynn Riess		Cheryl Ermel Cheryl Roberts Norma Barsi Margaret Rae

The authors also appreciate the assistance of Sherrilyn Phelps, Zane Lewchuk, Brian Sim, Jim Pratt, Ed Tanner, and Tom Boyle with recruitment of surveyors and organizing training sessions. Assistance with general coordination

was provided by Kari Harvey, Nancy Johnson and Doug Leask. A large thank you goes to Janet Schachtel and Corrine Harris for manually entering nearly 8000 producer names, addresses and telephone numbers into the database. This contact information was the foundation of all of the other activities involving the people above. The names of landowners were provided in part from the former Regional Land Titles offices and from the Information Services Corporation of Saskatchewan. Telephone numbers were accessed through local telephone directories.

The Central Information Services (computer design) Branch, Saskatchewan Highways and Transportation were also integral to the completion of the project through the development of an Oracle database to help with the management of co-operator information and the co-operator contact process. Thanks to Russ King, Sanjeeb Pandey, and Blain Walter for the design of a database program.

We want to thank each of the following people within Agriculture and Agri-Food Canada in Saskatoon and Regina for facilitating the expeditious summary of the survey results:

Debbie Mitchell and Brenda Baum (data entry)
Brett Hrynewich (data editing)
Ralph Underwood (cover design)
David Giffen (conversion of legal land locations to latitude/longitude coordinates)
Wade Nyirfa (PFRA drought map)

We are grateful to Henry deGooijer, Saskatchewan Land Resource Centre who provided access to a database facilitating the stratified selection of sites by ecodistrict and extension district.

Independent contractors, Conservation Learning Centre staff, Wheatland Conservation Area staff, University of Saskatchewan Crop Development Centre staff and Agriculture and Agri-Food Canada employees were responsible for conducting the field survey. We thank the following people for surveying fields.

History of Weed Survey Activities in Saskatchewan

Early reports on weeds in Saskatchewan (then part of the Northwest Territories) were lists of species with general statements of where they occurred and the seriousness of the problem¹. The first indication of the relative importance of seven serious weeds in Saskatchewan was obtained from reconnaissance surveys in 1930 and 1931². In these surveys, estimates of the prevalence and distributions of species were obtained from government officials and weed inspectors through interviews and questionnaires. Groh and Frankton³ published the results of their reconnaissance survey in 1949. They listed the frequency of occurrence of weeds in various areas of the province. In a questionnaire survey conducted during the 1960's by Alex⁴, the extension staff was asked to estimate the density and area infested with 40 species of weeds based on their knowledge of their specific Districts. These estimates for municipalities were presented on maps for each species. Although this survey provided information that was of great value at the time, researchers and extension specialists recognized, by the mid-1970's, a need for quantitative data based on weed counts in fields of producers.

The current series of surveys was initiated in 1975 in response to the need for quantitative data. These surveys collected data from weed counts in fields during July and early August. Information on the distribution and abundance of weeds occurring in cereal (spring wheat, barley, oats and fall rye) and oilseed crops (rapeseed and flax) in Saskatchewan was obtained in a series of summer surveys from 1976 to 1979⁵. A goal of 1000 fields was set for the 1976, 1978 and 1979 surveys. For the 1977 survey, the goal was increased to 1500 fields. The distribution of fields in the survey area was determined by a stratified random sampling procedure using the 43 Agricultural Extension Districts as the strata. The number of fields in each District was allocated in proportion to the area of the six crops. A minimum of ten sites was allocated to each District, resulting in an overrepresentation in Hudson Bay (District 25) and Meadow Lake (District 36) in relation to the number of cultivated hectares. Not all the selected sites in a District were surveyed each year because of staff limitations and other unforeseen circumstances. Distribution maps were produced for 30 species.

A question asked frequently is whether the species composition and density of the weed flora have changed since the last survey. Thus, surveys are needed to document the weed picture every few years so that these comparisons can be made. Consecutive annual surveys can only rarely be used to detect trends in weed distribution and abundance because shifts in weed populations occur slowly. Consequently, the initial series of four years of annual surveys was followed by a second survey conducted 7 years later in 1986⁶. Fields were allocated to the 43 Districts using the same procedure as in the 1976-1979 surveys. A goal of 1200 fields was set for the survey. The same six crops were included but separate weed summaries were not produced for fall rye because only four fields were surveyed. Distribution maps based on relative abundance were produced for 39 species.

During the 1980's specialized crops were the subjects of several separate complimentary surveys in Saskatchewan. These included a survey in 1985 of sunflowers⁷ and a survey of mustard, lentil and pea⁸. A series of surveys was also conducted in winter wheat each year from 1985 to 1988⁹.

A third survey in the series was conducted nine years later in 1995¹⁰. Since the 1986 survey a reduction in the frequency of fallow, an increase in the diversity of crops grown in rotations, a reduction in tillage and an increase in direct seeding had occurred. Canary seed, mustard, pea and lentil crops had a large enough acreage to be included in the survey for the first time. Fall rye, which had been included in previous surveys, was excluded. Durum wheat was treated as a separate crop from spring wheat. A goal of 1200 fields was set for the survey. Site selection utilized ecodistricts rather than Agricultural Extension Districts as the units for stratification. Distribution maps were produced for 38 species.

The 2003 Saskatchewan Weed Survey Project

Rationale

Eight years have past since the third survey in Saskatchewan was conducted in 1995. Numerous changes in the agricultural industry since the last survey have presented the need for a new survey with updated information. The last survey was conducted before the widespread adoption of herbicide-resistant canola varieties. The weed abundance and management data from the previous survey have provided an important baseline on residual weed populations in canola and the associated farm management practices prior to the widespread adoption of herbicide-tolerant varieties. The survey in 2003 will provide the information for an assessment of the impact of the adoption of this technology on weed communities in canola.

The weed survey data can be used to document the changes in the distribution and abundance of weeds that have occurred since the previous provincial surveys in 1995, 1986 and 1976 to 1979. Changes in weed abundance can be identified because all the surveys since 1976 have used a similar method of summarization. Individual weeds or groups of species identified as increasing in abundance can be targeted for attention by various agencies involved in weed science. The trends identified by the weed surveys are important to the research, industry, and extension communities for developing weed management recommendations for producers.

Objective

The objective of the project was to conduct, in 2003, the fourth weed survey in Saskatchewan since the series of provincial surveys began in the mid 1970s. The survey would measure the species compositions and population densities of the weed communities in the major summer annual crops grown in Saskatchewan.

Expected benefits of the provincial weed survey

1. Quantitative field surveys of weed populations are used to reveal the current size, extent, and order of importance of species in the province, ecoregions, extension districts, and other spatially defined areas of interest.

⁷ **Thomas, A.G. and R.F. Wise.** 1986. Weed survey of Saskatchewan sunflower fields (1985). Weed Survey Series Publ. 86-1. Agriculture Canada, Regina, Saskatchewan. 50 pp.

⁸ **Douglas, D.W. and A.G. Thomas.** 1986. Weed survey of Saskatchewan mustard, lentil and dry pea crops (1985). Weed Survey Series Publ. 86-2. Agriculture Canada, Regina, Saskatchewan. 157 pp.

⁹ **Thomas, A.G. and R.F. Wise.** 1989. Weed surveys of Saskatchewan winter wheat fields (1985-1988). Weed Survey Series Publ. 89-1. Agriculture Canada, Regina, Saskatchewan. 106 pp.

¹⁰ **Thomas, A. G., R. F. Wise, B. L. Frick and L. T. Juras.** 1996. Saskatchewan weed survey of cereal, oilseed and pulse crops in 1995. Weed Survey Series Publ. 96-1. Agriculture and Agri-Food Canada, Saskatoon, Saskatchewan. 130 pp.

2. The spatial distributions of the most common species are represented in maps that clearly illustrate areas of high and low abundance in relation to the physical landscape and jurisdictional areas of the province.
3. Tracking the increase or decrease in weed populations and the changes in the composition and structure of weed communities, using the database of survey information from the previous three surveys, will indicate the extent by which various weeds are spreading or being controlled and thus the effectiveness of weed management programs.
4. Crop yield losses due to specific weeds can be estimated and these loss estimates can be used to establish the economic costs.
5. Weed survey data can provide an objective basis for developing ecologically and economically sustainable strategies to manage agricultural weeds. The data are used to set research and education priorities, develop recommendations, and design weed management strategies in the research, extension, and agri-business communities.
6. Targeting of increasingly scarce scientific resources requires objective information on the species compositions and population densities of the weed communities that occur locally, regionally or provincially. Individual species or groups of species can be targeted for attention by various agricultural agencies.
7. Additional benefits of the weed survey will be realized when the results are combined with the information gathered in the farm management questionnaire survey. The questionnaire survey will provide detailed information on what farmers are doing to produce a crop. By combining the field and questionnaire survey data, particular weed management practices that are important determinants of distinctive weed communities can be determined.
8. Relating trends in weed populations and communities to the use of specific agronomic and weed control practices or to cropping systems will identify possible reasons that certain weeds have become more or less of a problem on an ecoregion, crop, or provincial basis.
9. Predicting shifts in weed populations and communities that might occur because of anticipated changes in agronomic practices, weed control management, and agricultural policy will allow agricultural agencies to develop weed management strategies that meet the future needs of farmers.

Study Area

The survey included the 29 million hectares of cultivated land of the province of Saskatchewan. This area extends from the border with the United States in the south (49°N latitude) to approximately $54^{\circ}30'\text{N}$ latitude on the west side of the province and 53°N latitude on the east side of the province. Saskatchewan is bordered on the east (102°W longitude) by the province of Manitoba and on the west (110°W longitude) by the province of Alberta.

Ecoregions and Ecodistricts

The survey area is represented by four major ecoregions and two smaller ecoregions¹¹ (Figure 1). Ecoregions are areas of similar, climate, natural vegetation, soils and land use. Each ecoregion consists of one or more ecodistricts (Figure 2). Ecodistricts are similar in landform, relief, surficial material, soil, vegetation and land use. Ecodistricts with less than ten sites were combined with adjacent ecodistricts in the summaries. Climate information for major ecodistricts included in the survey is given in Table 1.

The **Mid-Boreal Upland Ecoregion** includes a large block in the western portion of the province, north of the major agricultural area and four smaller uplands located to the south and east of this main area. Native vegetation in this ecoregion is a mixture of coniferous and deciduous trees dominated by trembling aspen, jack pine, black spruce, white spruce and balsam poplar. Gray Luvisols and Eutric Brunisols prevail on hummocky and ground moraine slopes. The lower slopes are dominated by Gleysols and Organic soils. Brunisols are common on sandy glaciofluvial, glacial till and eolian deposits. Agriculture is only common in the southern areas of the Mid-Boreal

¹¹ **Acton, D. F., G. A. Padbury, and C. T. Stushnoff.** 1998. The ecoregions of Saskatchewan. Hignell Printing Limited, Winnipeg, Manitoba. 205 pp.

Upland Ecoregion; therefore, the ecoregion is represented in the study by only four ecodistricts. The Bronson Upland and Porcupine Hills are two separate elevated uplands located within the Boreal Transition Ecoregion along the western and eastern edges, respectively. Leoville Hills and Emma Lake Upland are found at the southern edge of the larger contiguous area of the ecoregion. This ecoregion is combined with the Boreal Transition Ecoregion in the weed summaries.

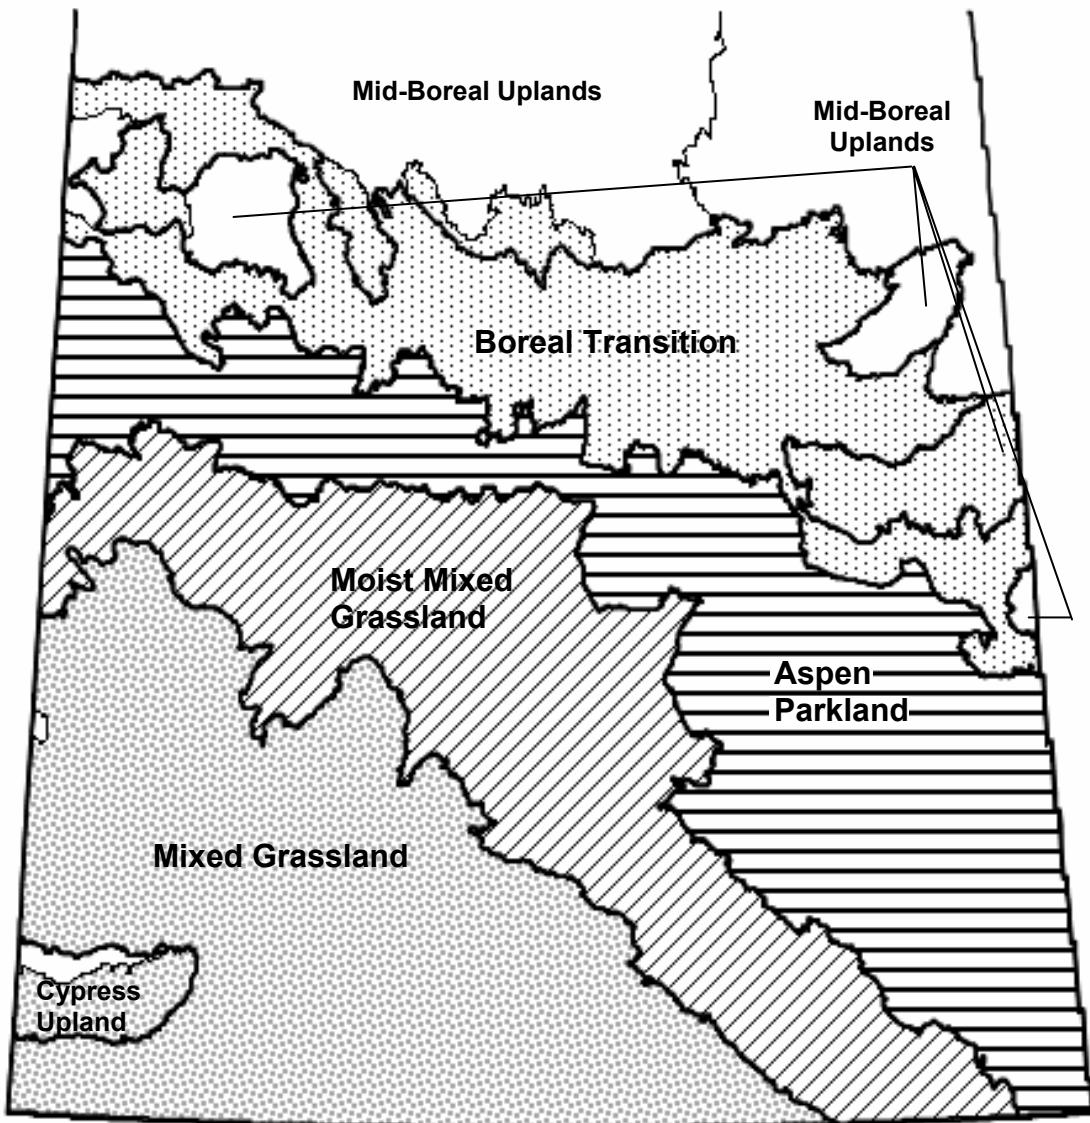

The **Boreal Transition Ecoregion** marks both the southern limit of the boreal forest and the northern limit of arable agriculture. The remaining native vegetation is primarily a deciduous boreal forest, dominated by trembling aspen; as the majority of the original grasslands have been cultivated. The ecoregion is a undulating to gently sloping plain, with glacial till and fluvioglacial deposits underlain by Cretaceous shale. Black and Dark Gray Chernozems are predominant in the southern areas on the ecoregion, while Dark Gray Luvisols soils occur in the north portion. As approximately half of this ecoregion is farmland, 22 of the 23 ecodistricts in this ecoregion were represented in the survey. An exception is the Frog Lake Upland, located on the Alberta border. This ecodistrict did not have enough cultivated land to be included in the weed survey.

The **Aspen Parkland Ecoregion** forms an arc across the province immediately south of the Boreal Transition Ecoregion. This area is a zone of transition between the forests to the north and grassland to the south. The native vegetation is dominated by trembling aspen and fescue grasslands. The ecoregion is a broad plain with hilly uplands. The area has glacial till, glaciolacustrine and glaciofluvial deposits. The dominant soil is a Black Chernozem. This ecoregion is a highly productive agricultural area. All 22 ecodistricts in this ecoregion were included in the survey.

The **Moist Mixed Grassland Ecoregion** is the most northern area of open grassland in the prairies. Native vegetation, where it remains, is dominated by spear grass and wheat grass. The ecoregion is composed of hummocky to kettled glacial till and level to very gently undulating lacustrine deposits. Dark Brown Chernozemic soils predominate throughout the ecoregion. Approximately 80% of the ecoregion is in agricultural production. All 20 ecodistricts in this ecoregion were included in the survey.

The **Mixed Grassland Ecoregion** is part of the semiarid shortgrass prairie, found to the south of the Moist Mixed Grassland Ecoregion. Native vegetation is dominated by spear grass, wheat grass and blue grama grass. The ecoregion is composed of dissected to kettled glacial till, undulating to dissected lacustrine sediments and hummocky Eolian deposits. Soils are predominantly Brown Chernozems. Cultivated land covers about half of the ecoregion. All 24 ecodistricts in this ecoregion are represented in the Saskatchewan survey, with the exception of Acadia Valley Plain Ecodistrict, which has too small a land base in Saskatchewan.

The **Cypress Uplands Ecoregion** is located within the Mixed Grassland Ecoregion, along the Alberta border. The native vegetation includes the prairie species found in the surrounding ecoregion, as well as lodge pole pine, white spruce and trembling aspen. The area is a plateau formed from very coarse gravel deposited by a migrating braided river during the Tertiary period. In some areas the bedrock is covered by glacial drift or glaciolacustrine deposits. Dark Brown Chernozems soils are dominant in the grassland areas, but Brown soils are also found at the lower elevations. Black, Dark Gray and Gray Luvisolic soils are found in the forested areas. About 21% of the area is cultivated. While sites were allocated in both of the ecodistricts in this ecoregion, no sites were surveyed in the Cypress Slope Ecodistrict. The sites surveyed in this ecoregion are combined with the Mixed Grassland Ecoregion in the weed summaries.

Area included in summaries of:

⋮⋮ Boreal Transition — Aspen Parkland // Moist Mixed Grassland ■■■ Mixed Grassland

¹⁴ Agriculture and Agri-Food Canada. 1997. Canadian ecodistrict climate normals 1961-1990. [Online] Available: <http://sis.agr.gc.ca/cansis/nsdb/ecostrat/district/climate.html> [25 November 2003].

¹⁵ Indented ecodistricts are combined with preceding ecodistricts in summaries

¹⁶ Annual potential evapotranspiration (PE) was estimated from climatic normals for each ecodistrict using the Thornthwaite method. A precipitation surplus/deficit was computed by subtracting the PE from total precipitation.

¹⁷ Growing season length is the total number of days when mean daily air temperature equals or exceeds 5 degrees Celsius

Crop Selection

The selection of cereal, oilseed and pulse crops to be included in the survey was based on the 2003 March seeding intentions for the province¹⁸ (Table 2). It was assumed that a similar proportion of crops would be grown in 2003. A minimum of 20 fields was set as the limit for inclusion of a crop in the survey. Based on a survey target of 2170 fields in Saskatchewan (4000 fields distributed proportionally amongst Alberta, Saskatchewan and Manitoba), five cereal crops, three oilseed crops and three pulse crops were selected.

Table 2. Area of the crops selected for the survey and the number of fields allocated to each crop

Crop	Seeding intentions (1,000 ha)	Proportion of area (%)	Expected number of fields
Cereal			
Spring wheat	4130	29.8	647
Barley	2145	15.5	336
Durum	1922	13.9	301
Oats	850	6.1	133
Canary seed	243	1.8	38
Oilseed			
Canola	2104	15.2	330
Flax	567	4.1	89
Mustard	263	1.9	41
Pulse			
Peas	971	7.0	152
Lentil	506	3.7	79
Chickpea	142	1.0	22
Total	13843	100.0	2170

Stratification of Sites

Ecodistricts were used as the strata in a stratified random-sampling procedure. The number of fields in an ecodistrict was allocated in proportion to the seeded area of the selected crops in the ecodistrict, relative to the total area seeded to selected crops in all ecodistricts (Table 3). Hectarage of field crops derived from the 1996 census data of Statistics Canada for each soil landscape complex (a subunit of ecodistrict) was obtained from the Soil Landscapes of Canada Database¹⁹ and summed to obtain hectarage per ecodistrict. To facilitate the organization of the survey for provincial staff, fields allocated to ecodistricts were subsequently allocated to Extension Districts based on proportion of each ecodistrict's area cultivated in each Extension District (Figure 3).

²¹ Saskatchewan Agriculture and Food. 1996. Extension Districts and Rural Service Centers Administrative Boundaries.

Random Site Selection

The random selection of sites used the legal land description grid established by the Dominion Land Survey System²² in western Canada. A random sample was selected from all quarter sections (65 ha) that had greater than 16 cultivated hectares within each target ecodistrict and extension district. A list that contained four times the allocated number of sites was developed for each ecodistrict.

The Oracle database was designed in the first quarter of 2003 to help with the management of producer information and the producer contact process. The database was housed in Regina, but was accessible by each Rural Service Center. Land owner information for the list of Legal Land Descriptions was acquired from a combination of the Master of Titles office and the Information Services Corporation of Saskatchewan, and then manually entered into a spreadsheet was then transferred to the database. Telephone numbers were added from local telephone directories.

Extension Client Service Representatives (CSR) acted as the primary contact point for producers. Producers were contacted, beginning in the last week in May and continuing through July. Sites were qualified, in the order that they were listed, until the required number of fields had been obtained. A site qualified if the person who farmed the land answered yes to all of the following questions.

1. Will you grant permission for a surveyor to count weeds on the selected quarter section during July or early August?
2. Is there a field in the quarter section seeded to a selected crop?
3. Is the field at least 16 hectares in size?
4. Have you farmed the identified field for a minimum of five years (including 2003)?
5. Is the identified field accessible by road?
6. Do you agree to complete a questionnaire on management practices used on the identified field in the fall?
7. Do you agree to allow a resistant weed survey to be conducted on same quarter in August?

If a field in a quarter section did not qualify, an attempt was made to qualify a field in another quarter of the same section. This step was followed only if the land was farmed by the same person as the preselected quarter section.

For each site, the following information was recorded into a database:

- (a) the name, mailing address, and telephone number of the farm operator for the qualified fields,
- (b) a new quarter section if it had been changed from the preselected site,
- (c) the crop seeded in the selected field and the identity of the underseeded crop if present,
- (d) the number of acres in the selected field.

Field Survey Personnel and Orientation Sessions

Surveyors were recruited by regional Soils and Crops Specialists and several Extension agrologists. The majority of the fields were surveyed by independent contractors (68%). 20% of the fields were surveyed by the Wheatland Conservation Area staff, 9% of the fields were surveyed by the Conservation Learning Centre staff and 1% of fields were surveyed by the University of Saskatchewan as represented by the Crop Development Centre. Agriculture and Agri-Food Canada employees surveyed the remaining 2% of the fields. A total of 34 people contributed to the weed counts.

Orientation sessions were held in Melfort, Saskatoon, North Battleford, Rosetown, Swift Current and Yorkton between June 24 and July 2 prior to the start of the field survey. Approximately 90% of the weed surveyors attended the session. The purpose of the session was to explain reasons for conducting a weed survey, how to implement the protocol, how to handle unknown weeds, how to record the weed data on the field sheets and how to interpret work lists created from qualified co-operators in the database. Half of the time in each session was devoted to weed identification. A list of the species found in the 1995 Saskatchewan survey was reviewed using illustrations from various weed identification guides. Potential identification problems with specific groups of species were highlighted during the session. Potted specimens of annual sow-thistle, spiny annual sow-thistle, perennial sow-

²² McKercher, R. B. and B. Wolfe. 1986. Understanding Western Canada's Dominion Land Survey System. Division of Extension and Community Relations, University of Saskatchewan, Saskatoon, SK.

thistle, prickly lettuce and Canada thistle at various stages of maturity were used to illustrate the differences among these species. Also, time was spent during each session identifying weeds at pre-selected weedy locations. Each surveyor was provided with a booklet summarizing the material presented at the training session. This booklet was made available to those who could not attend.

Timing of Weed Counts

Weeds that had not been controlled in the fields were counted in the summer survey. This time was chosen for several reasons. The weeds in the field were, in part, a result of agronomic management decisions (e.g., crop rotation, time and type of tillage, rate and placement of fertilizer, and selection, rate and effectiveness of herbicide used) made by the farm operator at various times during the crop year. The impact of these agronomic practices on the weed flora was reflected in a summer survey. Counts at this time of the year showed the size and extent of troublesome weed populations. This survey time had additional advantages. Identification was simplified because many of the weeds were mature. In particular, wild oats and other grassy weeds had flowered or produced fruit and were easily recognized. Also, the field crew had more time to work on the survey during the summer than during the period immediately after crop seeding. All weed counts were completed between June 25 and August 27.

Weed Counts in Fields

Once a surveyor arrived at a qualified field, the weeds were enumerated using a set pattern. The surveyor walked 100 paces along the edge of the field, turned at right angles, and walked 100 paces into the field. The inverted W-pattern began at this point (Figure 4). Five locations were sampled along each arm of the pattern, giving a total of 20 locations. Locations were 20 paces apart. The number of individuals of each weed species was determined in a 0.25 m^2 quadrat (50 cm by 50 cm) at each of the 20 locations. The procedure was modified when necessary to compensate for sloughs, odd-shaped fields and other irregularities.

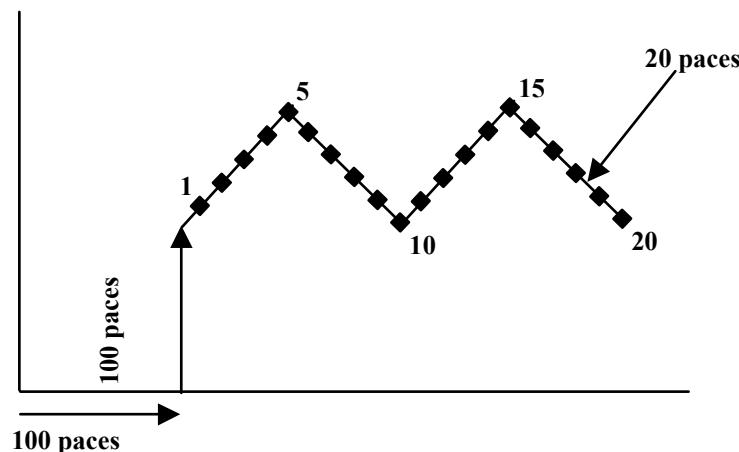

Figure 4. W-pattern used for field counts.

For perennial grass species such as quack grass and perennial herbaceous species such as Canada thistle, the number of shoots rather than the number of plants was counted. For annual grasses, such as wild oats, and clumped perennials, such as foxtail barley, a rooted individual was counted as a single plant whatever the number of tillers. Volunteer crop plants were counted as weeds. The underseeded species in a field was not counted.

Any plant found in the field that could not be identified, or that the surveyor was unsure of, was tagged, pressed, and submitted for identification. Infrequently occurring species were identified in this way. Two different broad-leaved species that could not be identified from the collected specimens are listed as ‘unknown broad-leaved species’ in the weed summaries. The common and botanical names of 124 weeds identified in 2003 are listed in Table 4.

Table 4. Common and scientific names²³ of plants that appear in this report

Common Name	Scientific Name
Absinth	<i>Artemisia absinthium</i> L.
Alfalfa	<i>Medicago sativa</i> L.
American dragonhead	<i>Dracocephalum parviflorum</i> Nutt.
American vetch	<i>Vicia americana</i> Muhl. ex Willd. var. <i>americana</i>
Annual sow-thistle	<i>Sonchus oleraceus</i> L.
Aspen poplar	<i>Populus tremuloides</i> Michx.
Ball mustard	<i>Neslia paniculata</i> (L.) Desv.
Barley	<i>Hordeum vulgare</i> L.
Barnyard grass	<i>Echinochloa crusgalli</i> (L.) P. Beauv.
Bicknell's geranium	<i>Geranium bicknellii</i> Britton
Biennial wormwood	<i>Artemisia biennis</i> Willd.
Black medick	<i>Medicago lupulina</i> L.
Black mustard	<i>Brassica nigra</i> (L.) W.D.J. Koch
Bluebur	<i>Lappula squarrosa</i> (Retz.) Dumort.
Borage	<i>Borago officinalis</i> L.
Broad-leaved plantain	<i>Plantago major</i> L.
Canada fleabane	<i>Conyza canadensis</i> (L.) Cronquist
Canada thistle	<i>Cirsium arvense</i> (L.) Scop.
Canary grass	<i>Phalaris canariensis</i> L.
Canola (Argentine)	<i>Brassica napus</i> L.
Canola (Polish)	<i>Brassica rapa</i> L.
Caraway	<i>Carum carvi</i> L.
Chickpeas	<i>Cicer arietinum</i> L.
Chickweed	<i>Stellaria media</i> (L.) Vill.
Cleavers	<i>Galium aparine</i> L.
Cocklebur	<i>Xanthium strumarium</i> L.
Common groundsel	<i>Senecio vulgaris</i> L.
Common pepper-grass	<i>Lepidium densiflorum</i> Schrad.
Coriander	<i>Coriandrum sativum</i> L.
Corn spury	<i>Spergula arvensis</i> L.
Cow cockle	<i>Vaccaria hispanica</i> (Mill.) Rauschert
Cream-colored vetchling	<i>Lathyrus ochroleucus</i> Hook.
Curled dock	<i>Rumex crispus</i> L.
Dandelion	<i>Taraxacum officinale</i> G. H. Weber ex Wiggers
Dog mustard	<i>Eructastrum gallicum</i> (Willd.) O.E. Schultz
Downy brome	<i>Bromus tectorum</i> L.
Fall rye	<i>Secale cereale</i> L.
False ragweed	<i>Iva xanthifolia</i> Nutt.
Field bindweed	<i>Convolvulus arvensis</i> L.
Field horsetail	<i>Equisetum arvense</i> L.
Field mint	<i>Mentha arvensis</i> L.
Field peas	<i>Pisum arvense</i> L.
Field violet	<i>Viola arvensis</i> Murr.
Flax	<i>Linum usitatissimum</i> L.
Flixweed	<i>Descurainia sophia</i> (L.) Webb ex Prantl

Foxtail barley	<i>Hordeum jubatum</i> L.
Goat's-beard	<i>Tragopogon dubius</i> Scop.
Green foxtail	<i>Setaria viridis</i> (L.) P. Beauv.
Green tansy mustard	<i>Descurainia pinnata</i> (Walter) Britton subsp. <i>brachycarpa</i> (Richardson) Detling
Hemp-nettle	<i>Galeopsis tetrahit</i> L.
Indian mustard	<i>Brassica juncea</i> (L.) Czern.
Kochia	<i>Kochia scoparia</i> (L.) Schrad.
Lamb's-quarters	<i>Chenopodium album</i> L.
Lentils	<i>Lens culinaris</i> Medic.
Low cudweed	<i>Gnaphalium uliginosum</i> L.
Maple-leaved goosefoot	<i>Chenopodium simplex</i> (Torr.) Raf.
Milk-vetch species	<i>Astragalus</i> spp.
Narrow-leaved hawk's-beard	<i>Crepis tectorum</i> L.
Night-flowering catchfly	<i>Silene noctiflora</i> L.
Nodding thistle	<i>Carduus nutans</i> L. subsp. <i>nutans</i>
Oats	<i>Avena sativa</i> L.
Pale smartweed	<i>Polygonum lapathifolium</i> L.
Pasture sage	<i>Artemisia frigida</i> Willd.
Perennial sow-thistle	<i>Sonchus arvensis</i> L.
Persian darnel	<i>Lolium persicum</i> Boiss. & Hohen. ex Boiss.
Pineappleweed	<i>Matricaria discoidea</i> D.C.
Povertyweed	<i>Iva axillaris</i> Pursh
Prairie coneflower	<i>Ratibida columnifera</i> (Nutt.) Wooton & Standl.
Prickly lettuce	<i>Lactuca serriola</i> L.
Prostrate knotweed	<i>Polygonum aviculare</i> L.
Prostrate pigweed	<i>Amaranthus blitoides</i> S. Watson
Purslane speedwell	<i>Veronica peregrina</i> L.
Pygmyflower	<i>Androsace septentrionalis</i> L.
Quack grass	<i>Elytrigia repens</i> (L.) Desv. ex B. D. Jacks
Rayless aster	<i>Brachyactis ciliata</i> (Ledeb.) Ledeb. subsp. <i>angusta</i> (Lindl.) A.G. Jones
Red clover	<i>Trifolium pratense</i> L.
Redroot pigweed	<i>Amaranthus retroflexus</i> L.
Rose species	<i>Rosa</i> spp.
Rough cinquefoil	<i>Potentilla norvegica</i> L.
Round-leaved mallow	<i>Malva pusilla</i> Sm.
Russian pigweed	<i>Axyris amaranthoides</i> L.
Russian thistle	<i>Salsola kali</i> L. subsp. <i>ruthenica</i> (Iljin) Soó
Scentless chamomile	<i>Matricaria perforata</i> Merat
Scouring-rush	<i>Equisetum hyemale</i> L.
Shepherd's-purse	<i>Capsella bursa-pastoris</i> (L.) Medik.
Silverweed	<i>Potentilla anserina</i> L.
Skeletonweed	<i>Lygodesmia juncea</i> (Pursh) D. Don ex Hook.
Slough grass	<i>Beckmannia syzigachne</i> (Steud.) Fernald
Small-leaved lamb's-quarters	<i>Chenopodium desiccatum</i> A. Nelson
Smooth brome	<i>Bromus inermis</i> Leyss.
Spear-leaved goosefoot	<i>Monolepis nuttalliana</i> (Schult.) Greene
Spiny annual sow-thistle	<i>Sonchus asper</i> (L.) Hill
Spreading dogbane	<i>Apocynum androsaemifolium</i> L.

(Table continued on next page)

Table 4. Common and scientific names of plants that appear in this report (*continued*)

Common Name	Scientific Name
Spring wheat/durum	<i>Triticum aestivum</i> L. & <i>T. durum</i> Desf.
Stinkweed	<i>Thlaspi arvense</i> L.
Stork's-bill	<i>Erodium cicutarium</i> (L.) L'Her.ex Aiton
Striate knotweed	<i>Polygonum achoreum</i> S.F. Blake
Sunflower	<i>Helianthus annuus</i> L.
Tall hedge mustard	<i>Sisymbrium loeselii</i> L.
Tansy	<i>Tanacetum vulgare</i> L.
Tartary buckwheat	<i>Fagopyrum tataricum</i> (L.) Gaertn.
Thyme-leaved spurge	<i>Euphorbia serpyllifolia</i> Pers.
Toad rush	<i>Juncus bufonius</i> L.
Tumble mustard	<i>Sisymbrium altissimum</i> L.
Tumble pigweed	<i>Amaranthus albus</i> L.
Vetch species	<i>Vicia</i> spp.
Water smartweed	<i>Polygonum amphibium</i> L. subsp. <i>laevimarginatum</i> Hultén
White clover	<i>Trifolium repens</i> L.
White cockle	<i>Silene pratensis</i> (Raf.) Godr. & Gren.
White mustard	<i>Sinapis alba</i> L.
White sweet-clover	<i>Melilotus albus</i> Medik.
Wild buckwheat	<i>Polygonum convolvulus</i> L.
Wild mustard	<i>Sinapis arvensis</i> L.
Wild oats	<i>Avena fatua</i> L.
Wild tomato	<i>Solanum triflorum</i> Nutt.
Witch grass	<i>Panicum capillare</i> L.
Wood whitlow-grass	<i>Draba nemorosa</i> L.
Wood-sorrel species	<i>Oxalis</i> spp.
Wormseed mustard	<i>Erysimum cheiranthoides</i> L.
Yellow foxtail	<i>Setaria pumila</i> (Poir.) Roem. & Schult.
Yellow sweet-clover	<i>Melilotus officinalis</i> (L.) Pall.
Yellow toadflax	<i>Linaria vulgaris</i> Mill.

Data analysis

Weed count data on field sheets were numerically coded, entered into computer files, and verified. Data were processed in Microsoft® Excel and summary tables were produced following the standard format used in previous Weed Survey Series Reports.

Weed data were summarized in tables using ecological, agronomic, and jurisdictional variables including ecoregion (Figure 1), ecodistrict (Figure 2), crop, Extension District (Figure 3) and Extension Region (Figure 5). A minimum of ten sites was set to allow meaningful summarization. Where these minima were not reached for a crop, a summary table was not provided, but data were retained in other appropriate summaries. For example, a separate summary table for chickpea was not provided, however, the fields were included in the appropriate overall summaries for areas and pulse summaries. Geographic areas (ecoregions and ecodistricts) with fewer fields than required were combined with adjacent areas.

The geographic distribution of 37 frequently occurring species is presented in maps based on ecodistricts. Relative abundance is used as the mapping variable. Distribution maps were produced with ArcView GIS 3.2 from Environmental Systems Research Institute, Inc..

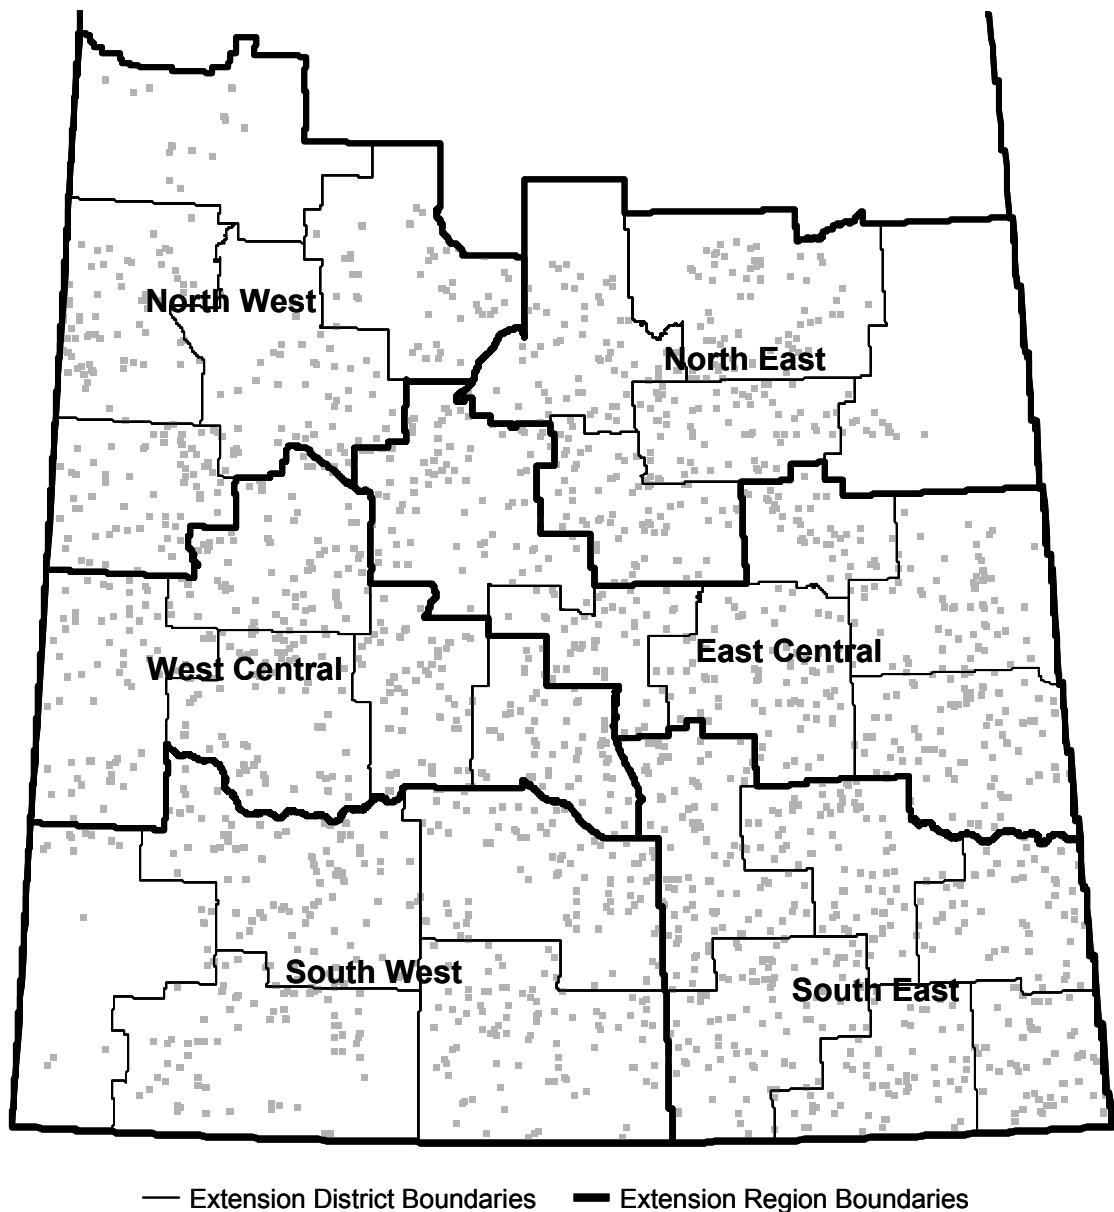

Figure 5. Surveyed area in Extension Regions²⁴. Squares indicate locations of surveyed fields.

²⁴ Saskatchewan Agriculture and Food. 1996. Extension Districts and Rural Service Centers Administrative Boundaries.

Data were summarized using seven quantitative variables. Details for the calculation of these variables are described elsewhere²⁵.

Frequency. The number of fields in which a particular species occurred, expressed as a percentage of the total number of fields surveyed in groups such as crops, ecoregions, or ecodistricts, and in the province.

Field uniformity (all fields). The number of quadrats in which a particular species occurred, expressed as a percentage of all the quadrats surveyed in groups such as crops, ecoregions, or ecodistricts, and in the province (20 per field multiplied by the number of fields).

Field uniformity (occurrence fields). The number of quadrats in which a particular species occurred, expressed as a percentage of the number of quadrats in groups such as crops, ecoregions, or ecodistricts, and in the province for the occurrence fields only (20 per field multiplied by the number of fields in which the species occurred).

Field density (all fields). A measure of the number of plants of a species counted in a square metre. The density values for each species in a single field are averaged over all fields surveyed in groups such as crops, ecoregions, or ecodistrict, and in the province.

Field density (occurrence fields). A measure of the number of plants of each species counted in a square metre. The density values for each species in a single field are averaged over only the fields in which the weed occurred in groups such as crops, ecoregions, or ecodistrict, and in the province.

High density. The highest field density values recorded for a species in groups such as in groups such as crops, ecoregions, or ecodistricts, and in the province.

Relative abundance. A combination of the frequency, field uniformity (all fields) and field density (all fields) values for each species.

Relative frequency for a species (RF) is the frequency value for a species divided by the sum of frequency values for all species, expressed as a percentage.

Relative field uniformity (all fields) for a species (RU) is the field uniformity value for a species divided by the sum of field uniformity values for all species, expressed as a percentage.

Relative field density (all fields) for a species (RD) is the field density value for a species divided by the sum of field density values for all species, expressed as a percentage.

Relative abundance for a species = RF + RU + RD. The total of the relative abundance values for all species equals 300. This measure was used to rank the species in the field survey summary tables. This calculation assumed that the frequency, field uniformity and field density measures were equally important in estimating the abundance of a species. Relative abundance has no units attached to it, but the value for one species can be compared with the value of another species. For example, if green foxtail has a value of 36 and wild buckwheat 18, then green foxtail is twice as abundant as wild buckwheat. Relative abundance does not necessarily relate to the competitive ability of the species. A species may have a high relative abundance value but not be very competitive.

Guide to the Use of the Field Survey Summary Tables

For the purposes of illustration, the meaning of the variables is explained for the species green foxtail in the provincial summary table (Table 5). A **frequency** of 43.5% means that green foxtail occurred at least once in 890 of the 2046 fields surveyed. This variable estimates the geographic extent of the weed.

Field uniformity shows the proportion of quadrats (20 per field) in which the species occurred. In the example, the value for **all field uniformity** means that green foxtail occurred in 17.9% of the quadrats surveyed. This variable

²⁵ Thomas, A. G. 1985. Weed survey system used in Saskatchewan for cereal and oilseed crops. Weed Science 33: 34-43.

can be used as an estimate of the area occupied by a weed. The **occurrence field uniformity** value means that green foxtail was present in 41.2% of the quadrats when considering only the 890 occurrence fields.

Three density variables are included in the tables. Green foxtail had an **occurrence field density** of 24.4 plants per square metre and an **all field density** of 10.6 plants per metre square. The density for fields in which the species occurred is always equal to or higher than the density for all the fields in the summary. The **maximum density** shows that at least one field had a density of 568.4 green foxtail plants per square metre.

The final column shows the abundance of each species surveyed relative to each other. Values in this column add up to 300. **Relative abundance** is derived from the values of the frequency, field uniformity (all fields) and density (all fields) variables. The relative abundance variable is used for ranking species such as green foxtail and wild oats. Because the all field density and all field uniformity value of green foxtail is larger than that for wild oats, green foxtail is ranked higher, even though wild oats has a higher frequency. The relative abundance value of 67.4 for green foxtail is higher than the value of 41.9 for wild oats.

Limitations, Constraints and Biases

The survey protocol has been designed to reduce bias in sampling, and to obtain objective information on the weed flora that remains after control practices have been used by the producer. In the development of the protocol, several constraints were placed on the eligibility of areas and fields for inclusion in the survey. The survey covers the main area of agriculture in the province. Only the major agricultural crops were considered. Other crops may have different weed floras. Fields were limited to those with an area greater than 16 ha. Fields were only surveyed if producers had used the field for a minimum of five years, if they were accessible by road, and if the producers were willing to cooperate. These constraints will have altered the spectrum of fields slightly from a completely random sample.

For a variety of reasons, some sites on the final list are different from those on the stratified random list developed initially. Sometimes site qualification was difficult because land owners could not be identified or contacted. In these instances, provincial staff may not have used the selected sites in the order given them, but may have selected producers in the area that they knew to be cooperative. This will have biased qualification of sites. When surveyors went to the field, they were given a list of preselected and qualified sites. Sometimes mistakes were made, and the legal description given was not in an appropriate crop, sufficiently accessible, or in another way not a legitimate site. In this instance, the surveyor made an alternative selection, usually in the immediate vicinity. Sometimes the alternate selections were in different ecodistricts. In three cases, the field was planted to mixtures of the selected crops. These fields were included in overall summaries, but a separate summary was not made for mixed crops.

The distribution of the fields amongst the surveyed crops differs from expected based on original estimates (Table 2). When compared to 2003 March seeding intentions²⁶, the survey included a higher proportion of oilseed, canary seed and barley fields and lower number of pulse, oat, spring wheat and durum fields than expected.

Only a small portion of each field was surveyed. This portion intentionally did not include sloughs, field edges, shelterbelts, etc. It also did not extend into the less accessible areas of the field. This may limit the representation of some species, such as foxtail barley, that are found more commonly near saline sloughs, or brome grass that is often found near field margins. The small area in the field was sufficient to illustrate the distribution of major species and minor species that might be important to agriculture. This level of sampling is not sufficient to give an exhaustive list of the flora, or to illustrate the distribution of rare species.

The identification of some weed species is difficult in the field. Surveyors were trained, and asked to send in unknowns for identification. However, mistakes may have been made. In some cases, the common names of species differ in different areas. For instance, this might have caused some confusion between lamb's-quarters and redroot pigweed. Despite efforts during training sessions, the distinction between spiny annual sow-thistle, annual sow-thistle and perennial sow-thistle may have been difficult for some surveyors as the annual sow-thistles are often

²⁶ Statistics Canada. 2003. March intentions of Principal Field Crop Areas, Canada 2003. Field Crop Reporting Series No. 2, Vol. 82. Ottawa, Canada.

not distinguished from each other. Generally, the identification and counts by the field surveyors were used without alteration. No attempt was made to distinguish between thyme-leaved spurge and ridge-seed spurge, both known to occur within Saskatchewan, as differentiation between these species requires microscopic features on mature plants. Both of these species were grouped under thyme-leaved spurge.

The weed survey recorded the numbers of individuals of each species. It does not show the vigour, the biomass or the competitive ability of the plants found in the field. The survey shows what was there, not its effect on the crop. In the survey analysis, all species are considered separately. The complex interrelationships among species have not been considered. This will be the subject of later analyses. Relationships between species and farm management practices will be considered in a further publication in this series. The relationships between species and field variables (for instance, distribution patterns in the field) are not considered.

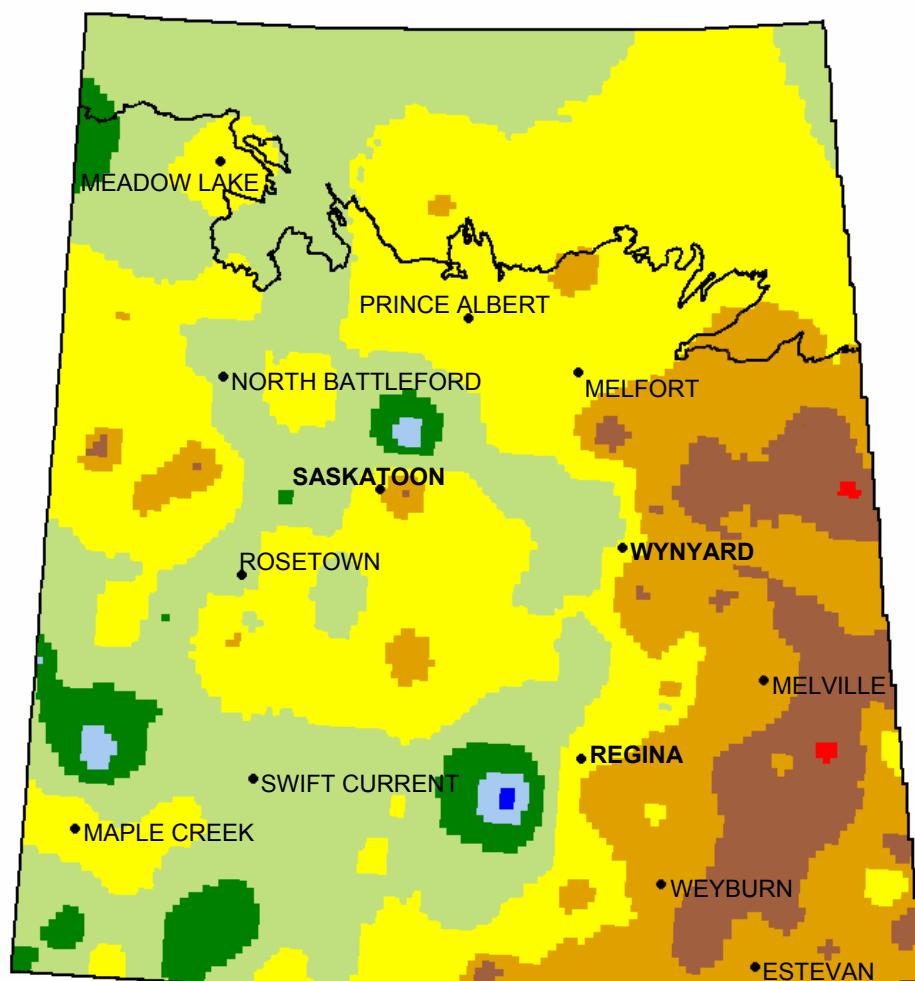

The results in this report provide a ‘snapshot’ of the size and extent of weed populations in agricultural ecoregions of Saskatchewan in 2003. It might be argued that 2003 is not indicative of a typical year throughout Saskatchewan as the majority of the province had low precipitation in comparison with historic levels (Figure 6). The eastern part of the province experienced very low precipitation while a few areas had higher than average precipitation. Differences in precipitation and temperature may favour some weeds over others, or may result in higher or lower weed numbers in some areas than usual for the period as a whole. Consequently, only dramatic or consistent trends in the weed data are considered as important. Minor fluctuations may result from simple year-to-year variation.

Figure 6. 2003 precipitation compared to historical distribution. A percentile is a value on a scale of one hundred that indicates the percent of distribution that is equal to or below it. For example, extremely low precipitation (0 to 10th percentile) indicates the precipitation accumulation in 2003 equals the lowest or is equal to or less than the lowest 10% of the values in the historical record. The precipitation for 2003 matches the lowest precipitation conditions or the lowest that occur on average 10 times in every 100 years.

List of Summary Tables in Part III

Table No.

Province

5	Provincial summary	31
---	--------------------------	----

Crop

6	Number of fields surveyed, density, species richness and weed-free quadrats in the surveyed crops	34

Table 70. Number of fields surveyed in each ecodistrict (*continued*)

Ecoregion and Ecodistrict Group	Ecodistrict	Number of Fields Surveyed
Moist Mixed Grassland		
Tramping Lake Plain, Neutral Hills & Senlac Hills (767, 771 & 768)	767 Tramping Lake Plain	66
	771 Neutral Hills	6
	768 Senlac Hills	5
Goose Lake Plain (770)	770 Goose Lake Plain	41
Saskatoon Plain & Moose Wood Sand Hills (772 & 776)	772 Saskatoon Plain	7
	776 Moose Wood Sand Hills	6
Elstow Plain & Minichinas Upland (773 & 774)	773 Elstow Plain	35
	774 Minichinas Upland	5
Bear Hills & Biggar Plain (775 & 778)	775 Bear Hills	9
	778 Biggar Plain	2
Rosetown Plain (780)	780 Rosetown Plain	44
Arm River Plain & Allan Hills (782 & 785)	782 Arm River Plain	67
	785 Allan Hills	8
Strasbourg Plain (783)	783 Strasbourg Plain	40
Last Mountain Lake Plain (784)	784 Last Mountain Lake Plain	16
Eyebrow Plain (789)	789 Eyebrow Plain	18
Regina Plain (792)	792 Regina Plain	106
Griffin Plain & Souris River Plain (794 & 796)	794 Griffin Plain	63
	796 Souris River Plain	6
Trossachs Plain (795)	795 Trossachs Plain	36
Mixed Grassland & Cypress Uplands		
Kerrobert Plain & Bad Hills (803 & 807)	803 Kerrobert Plain	17
	807 Bad Hills	7
Sibbald Plain & Oyen Upland (805 & 809)	805 Sibbald Plain	7
	809 Oyen Upland	7
Eston Plain (808)	808 Eston Plain	59
Coteau Hills (810)	810 Coteau Hills	11
Beechy Hills (813)	813 Beechy Hills	12
Chaplin Plain (816)	816 Chaplin Plain	38
Hazlet Plain, Schuler Plain & Bindloss Plain (817, 821 & 815)	817 Hazlet Plain	15
	821 Schuler Plain	3
	815 Bindloss Plain	2
Antelope Creek Plain, Great Sand Hills & Maple Creek Plain (820, 819 & 827)	820 Antelope Creek Plain	16
	819 Great Sand Hills	1
	827 Maple Creek Plain	1
Dirt Hills (822)	822 Dirt Hills	11
Swift Current Plateau & Gull Lake Plain (825 & 824)	825 Swift Current Plateau	54
	824 Gull Lake Plain	7
Wood River Plain (826)	826 Wood River Plain	81
Coteau Lake Upland (830)	830 Coteau Lake Upland	41
Lake Alma Upland (831)	831 Lake Alma Upland	22
Wood Mountain Plateau (832)	832 Wood Mountain Plateau	30
Climax Plain, Wild Horse Plain, Cypress Hills & Old Man on His Back Plateau (834, 833, 838 & 835)	834 Climax Plain	20
	833 Wild Horse Plain	3
	838 Cypress Hills	3
	835 Old Man on His Back Plateau	2

Table 71. Meadow Lake Plain, Beaver River Plain, Bronson Upland & St. Cyr Plain Ecodistricts (685, 680, 710 & 682) in the Boreal Transition Ecoregion (14 fields)

Residual Weed Populations in Saskatchewan – 1976 to 2003

Abstract for Poster Presented at Canadian Weed Science Society Annual Meeting, December 1-3, 2003

The comparison of the relative abundance of weeds in Saskatchewan in 2003 with results from previous provincial surveys enables the identification of recent shifts in species ranks, life form density and relative abundance. In 2003, 2046 fields of spring wheat, barley, durum, oat, canary seed, canola, flax, mustard, lentil and pea were surveyed. These fields were selected using a stratified random sampling procedure based on ecodistricts. In each field, weeds were counted in 20 quadrats (50 by 50 cm) in late summer. Weed data are summarized using a relative abundance index based on frequency, field uniformity and density. Green foxtail (*Setaria viridis* (L.) P. Beauv.) was the most abundant weed, wild oats (*Avena fatua* L.) ranked second, wild buckwheat (*Polygonum convolvulus* L.) third and Canada thistle (*Cirsium arvense* (L.) Scop.) fourth. The results from the 2003 survey are compared to results from surveys of 1178 fields in 1995, 1149 fields in 1986 and 4423 fields in 1976-1979. Twelve species have been ranked amongst the top 20 most abundant species in each survey. Seven species, ranked in the top 20 species in the 1970's and/or 1986, have since declined: rose (*Rosa* spp.), prostrate pigweed (*Polygonum aviculare* L.), night-flowering catchfly (*Silene noctiflora* L.), cow cockle (*Vaccaria hispanica* (Mill.) Rauschert), bluebur (*Lappula squarrosa* (Retz.) Dumort.), pale smartweed (*Polygonum lapathifolium* L.), flixweed (*Descurainia sophia* (L.) Webb ex Prantl). Six species have appeared in the top 20 list in the 1995 and/or 2003: cleavers (*Galium aparine* L.), barnyard grass (*Echinochloa crusgalli* (L.) P. Beauv.), wheat (*Triticum aestivum* L.), dandelion (*Taraxacum officinale* Weber in F.H. Wigg.), quack grass (*Elytrigia repens* (L.) Desv. ex B.D. Jacks), canola (*Brassica napus* L.). Relative abundance of annual grass and perennials has increased, while relative abundance of annual broad-leaved species and facultative winter annuals have decreased. Densities of all life forms have decreased since the 1970's.

Residual Weed Populations in Saskatchewan - 1976 to 2003

Julia Y. Leeson¹, A. Gordon Thomas¹ and Clark Brenzil²

¹Agriculture and Agri-Food Canada, Saskatoon, SK; ²Saskatchewan Agriculture, Food and Rural Revitalization, Regina, SK

Objectives

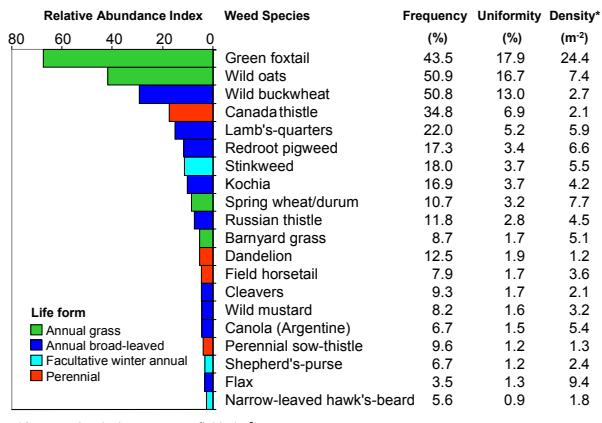

- Present the top twenty species in 2003 Saskatchewan provincial weed survey
- Compare the relative abundance of weeds in Saskatchewan in 2003 with results from the 1995, 1986 and 1976-1979 provincial surveys
- Identify shifts in life form density and relative abundance

Methods

- Used stratified random sampling procedure to select fields in ecodistricts shown on map
- Surveyed 2046 fields of spring wheat, barley, durum, oat, canary seed, canola, flax, mustard, peas, lentil and chickpea
- Counted weeds in 20 quadrats (50 by 50 cm) per field in late summer (residual populations)
- Summarized weed data using a relative abundance index based on frequency, field uniformity and density
 - Frequency = Percent of fields in which species occurred
 - Uniformity = Percent of quadrats in which species occurred
 - Density = Average density of species in all fields
- Compared top twenty species from surveys of
 - 1178 fields in 1995
 - 1149 fields in 1986
 - 4423 fields in 1970's (1976-1979)

Top 20 Species in 2003 Survey

Species Shifts

	Change in Relative Abundance Rank			
	1970's to 1986	1986 to 1995	1995 to 2003	1970's to 2003

Rose species	-5	-10	-16	-31

*Species in italics have maintained a position in the top 20 since 1970's

Species Shift Summary

- Shifts have occurred in the relative abundance of the top 20 species
- Twelve species have been present in the top 20 in each survey since the 1970's
 - The same species have been in the top three since surveys in the 1970's
- Seven species in top 20 in the 1970's and/or 1986 have declined
 - Rose species, prostrate pigweed, night-flowering catchfly, cow cockle, bluebur, pale smartweed, flixweed
- Six species have appeared in top 20 in 1997 and/or 2003
 - Cleavers, barnyard grass, wheat, dandelion, quack grass, canola

Life Form Shifts

Life Form Shift Summary

- Composition of weed community similar since the 1970's but densities have decreased
 - Similar observations were made in Alberta and Manitoba
 - Largest decreases in density since 1995 in facultative winter annuals and perennials
- Relative abundance of annual grasses and perennials have increased
 - Relative abundance of perennials peaked in 1995
- Relative abundance of annual broad-leaves and facultative winter annuals have decreased
 - Change in relative abundance of annual broad-leaves was largest from 1970's to 1995
 - Change in relative abundance of facultative winter annuals was largest from 1986 to 2003

Next Step

- Interpret shifts in terms of management practices based on information obtained from questionnaires completed by producers who participated in the survey

Acknowledgements

- The weed surveys were only possible because of the cooperation of over 8800 producers
- Special thanks to the many provincial and federal staff and survey personnel who participated in the 2003 survey
- Funded in part by Arvesta Canada, Aventis CropScience Canada Co., BASF Canada, Bayer Inc., Dow AgroSciences Canada Inc., Dupont Canada Inc., Monsanto Canada Inc., Nufarm Agriculture Inc. and Western Co-operative Fertilizers Limited, and by Matching Investment Initiative (MII) of Agriculture and Agri-Food Canada

| ■ 0.1 to 1 | ■ More than 10 |

Flixweed

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

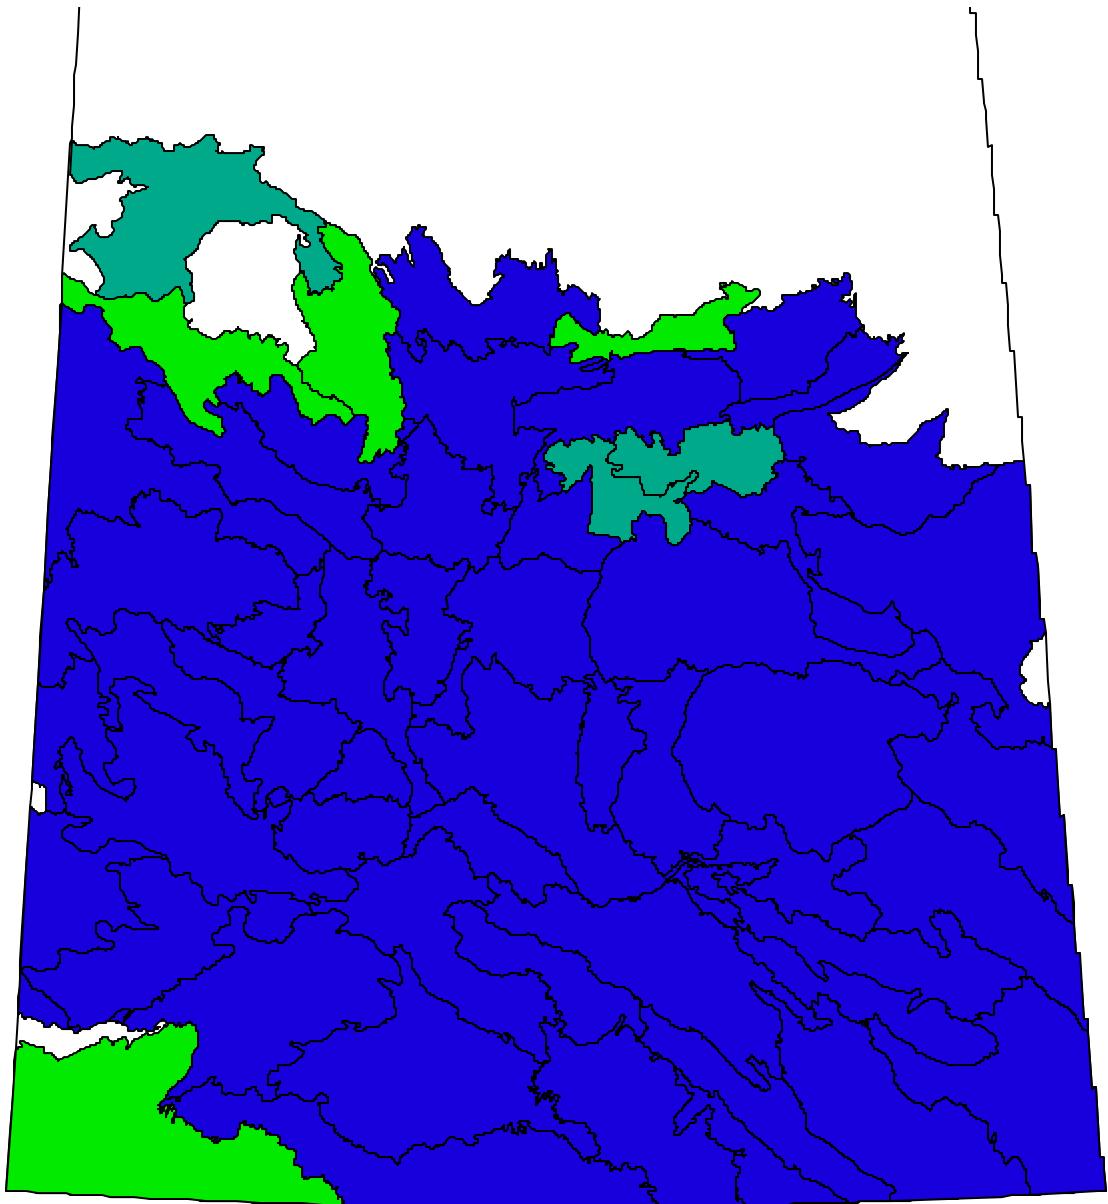

Foxtail barley

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

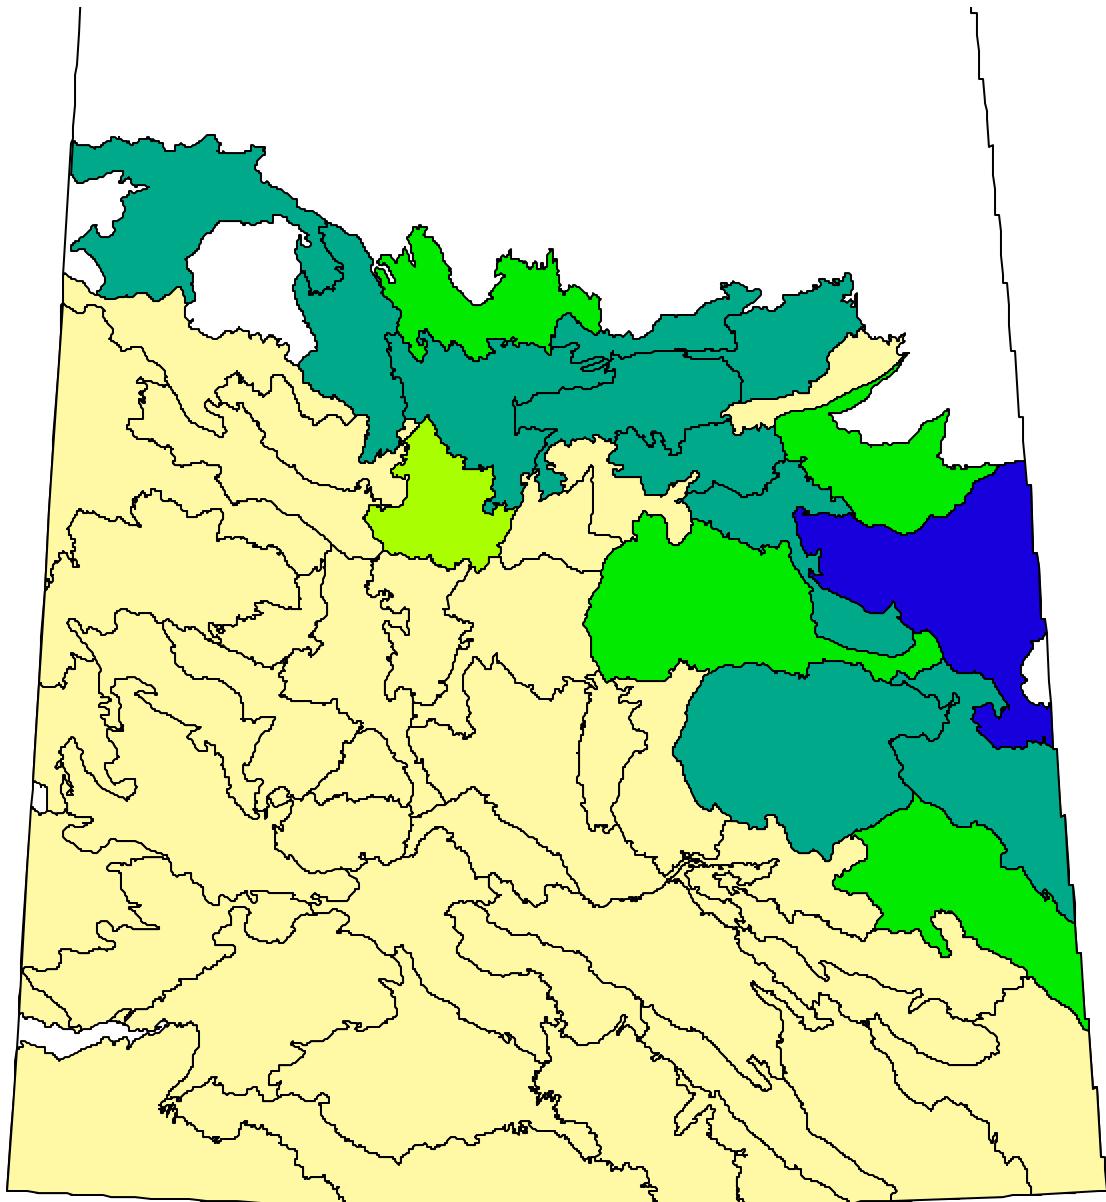

Green foxtail

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

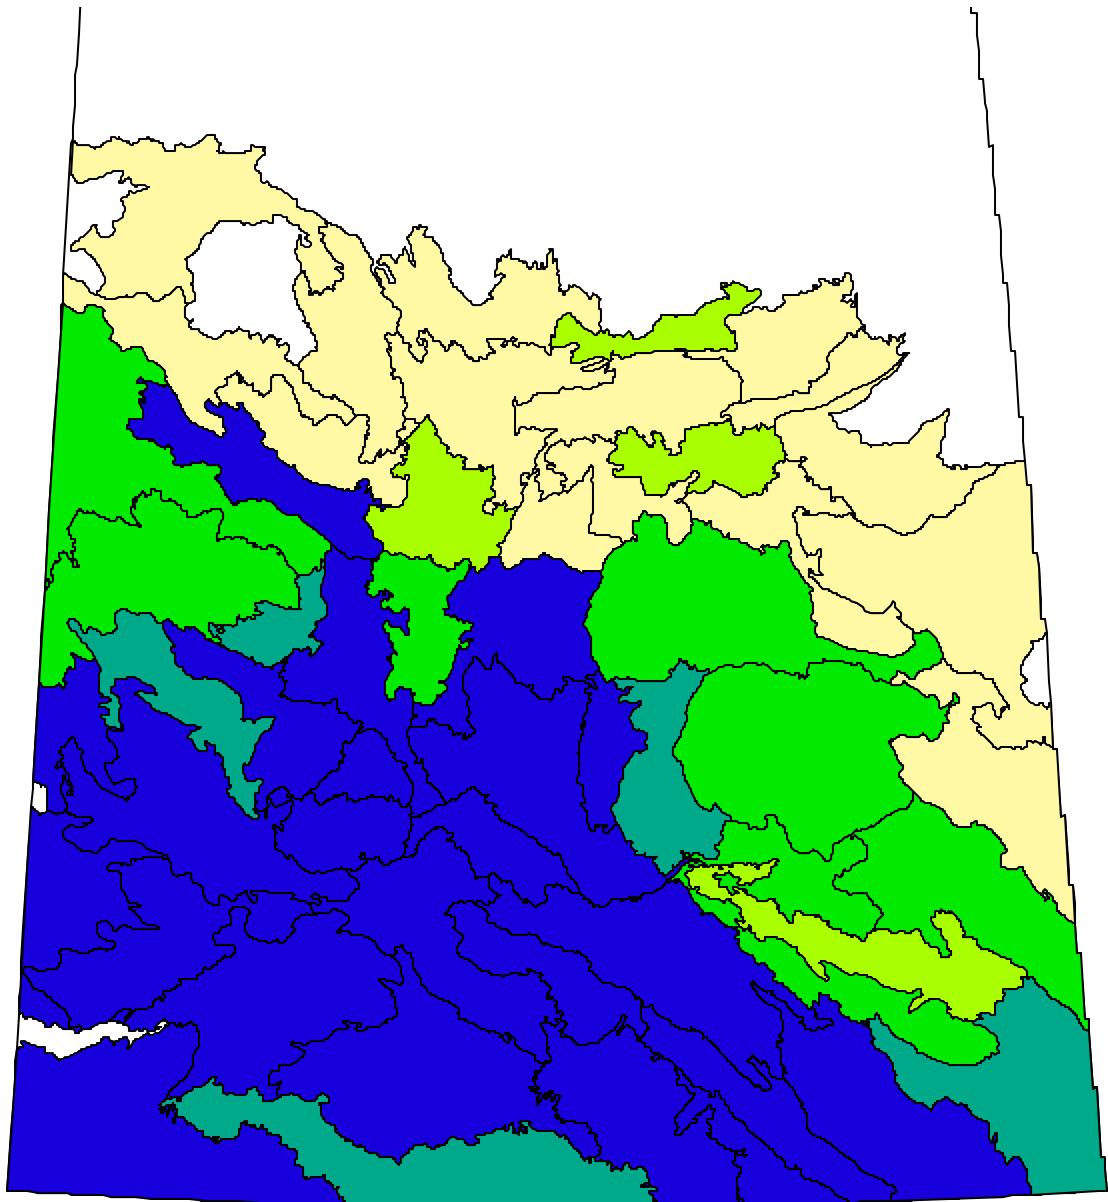

Hemp-nettle

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

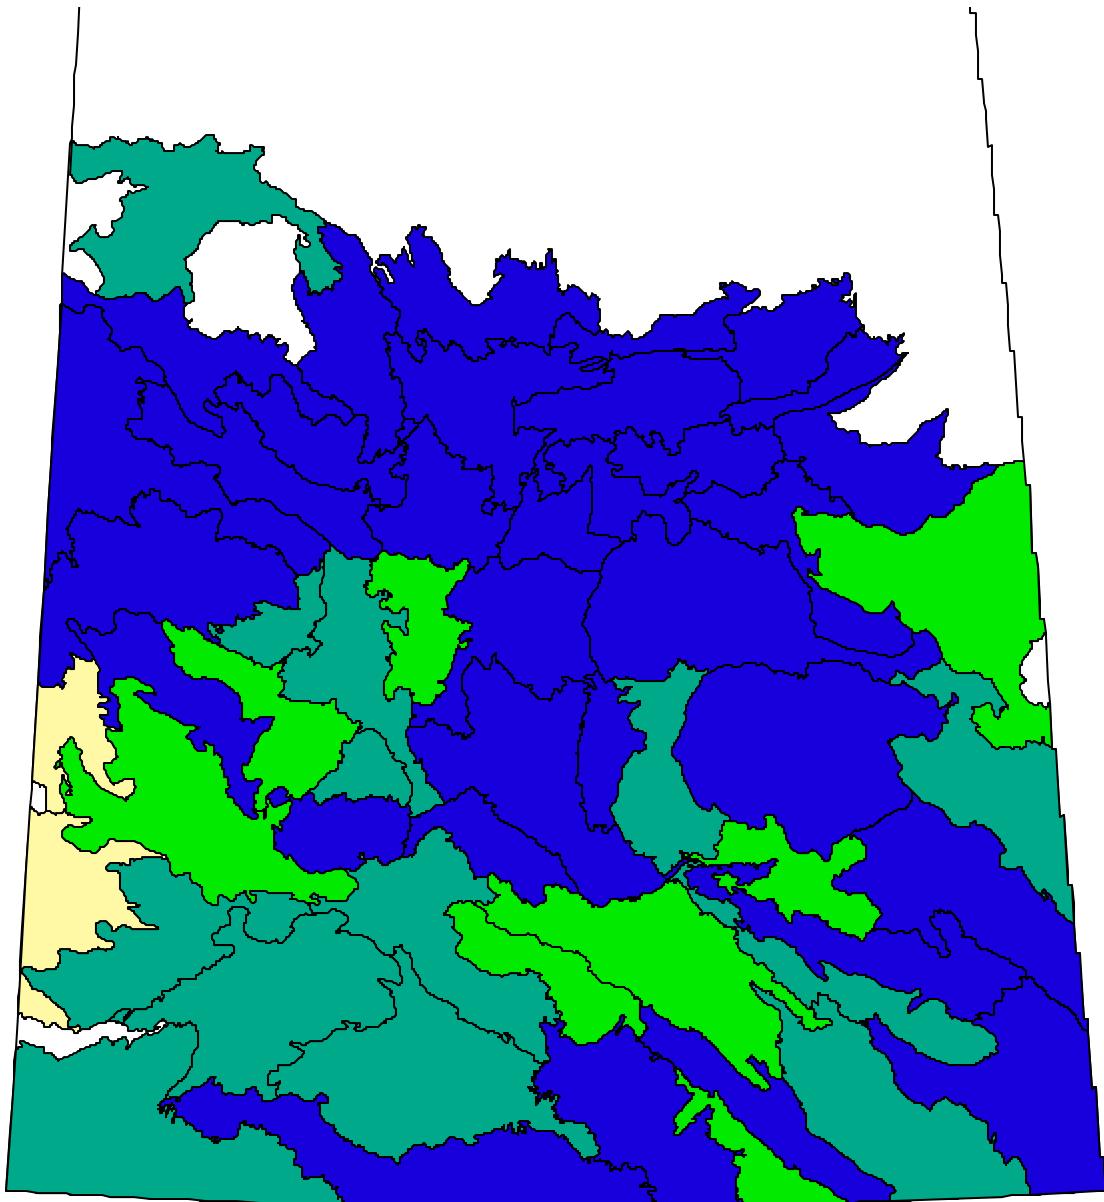

Kochia

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

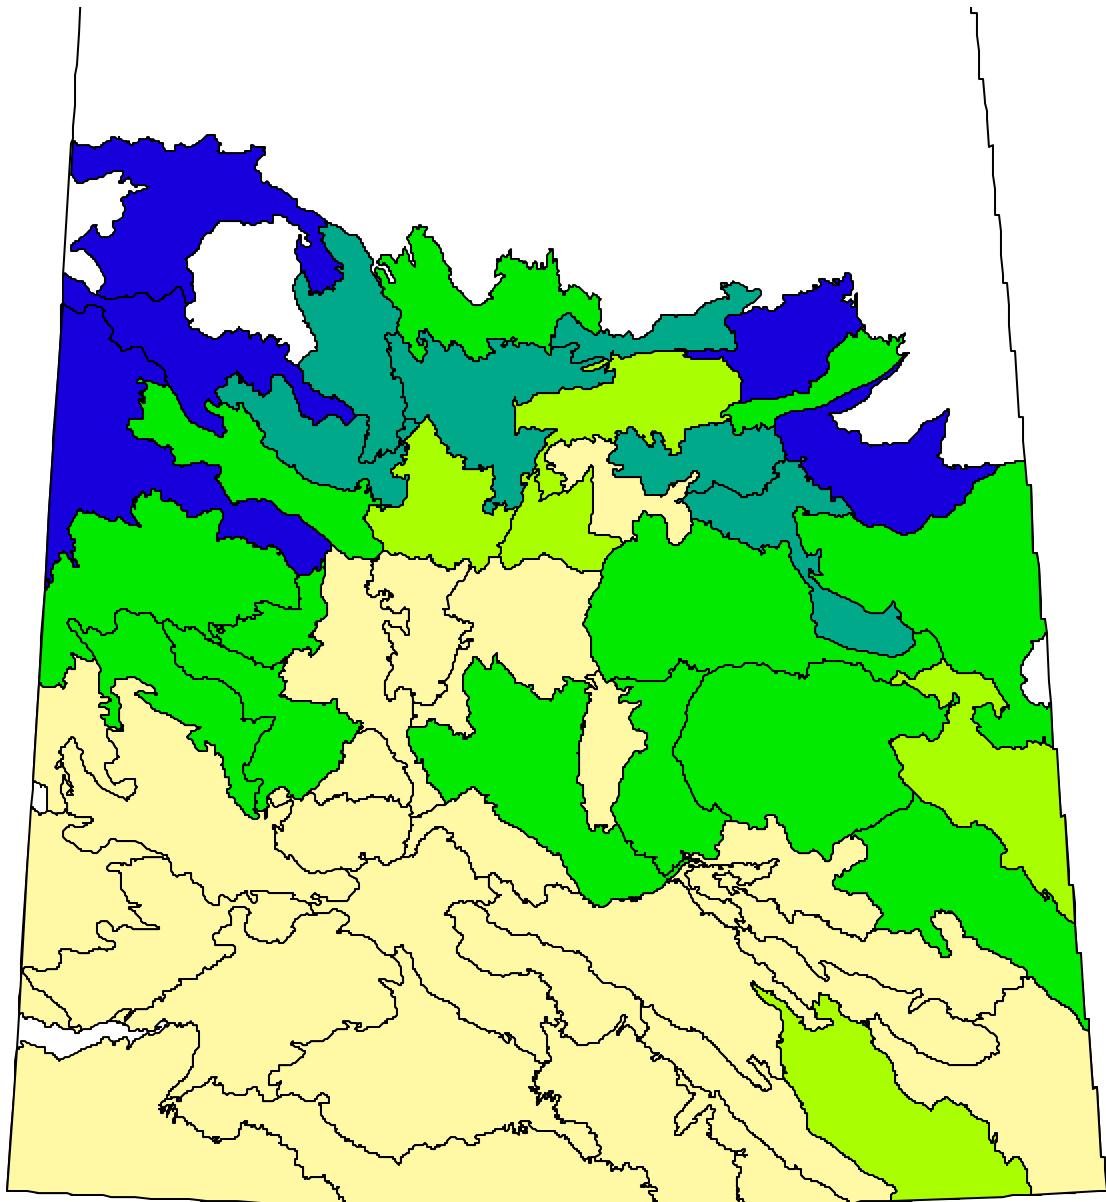

Lamb's-quarters

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

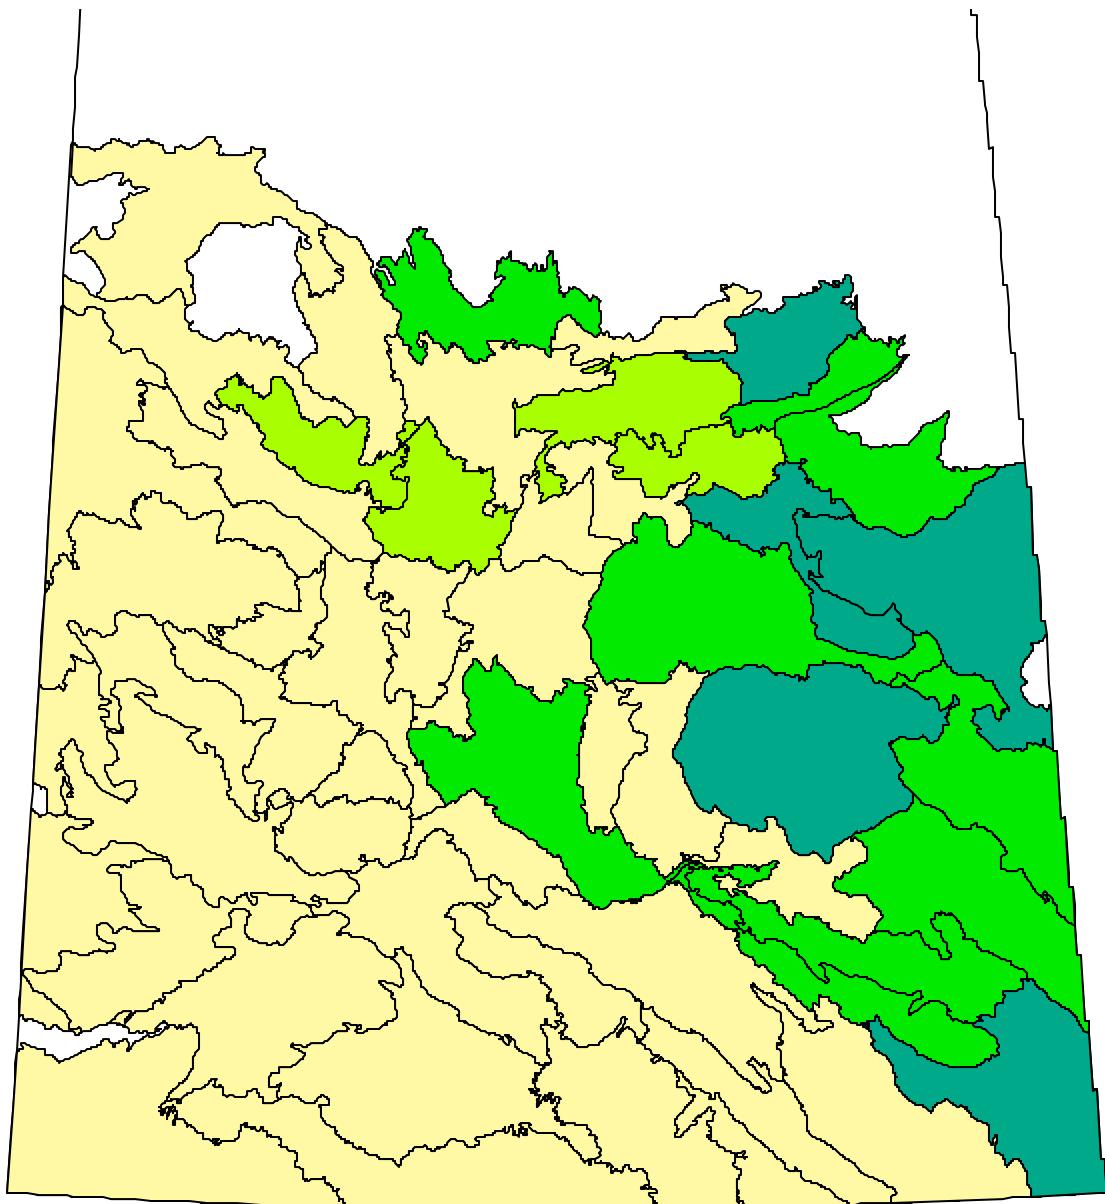

Narrow-leaved hawk's-beard

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

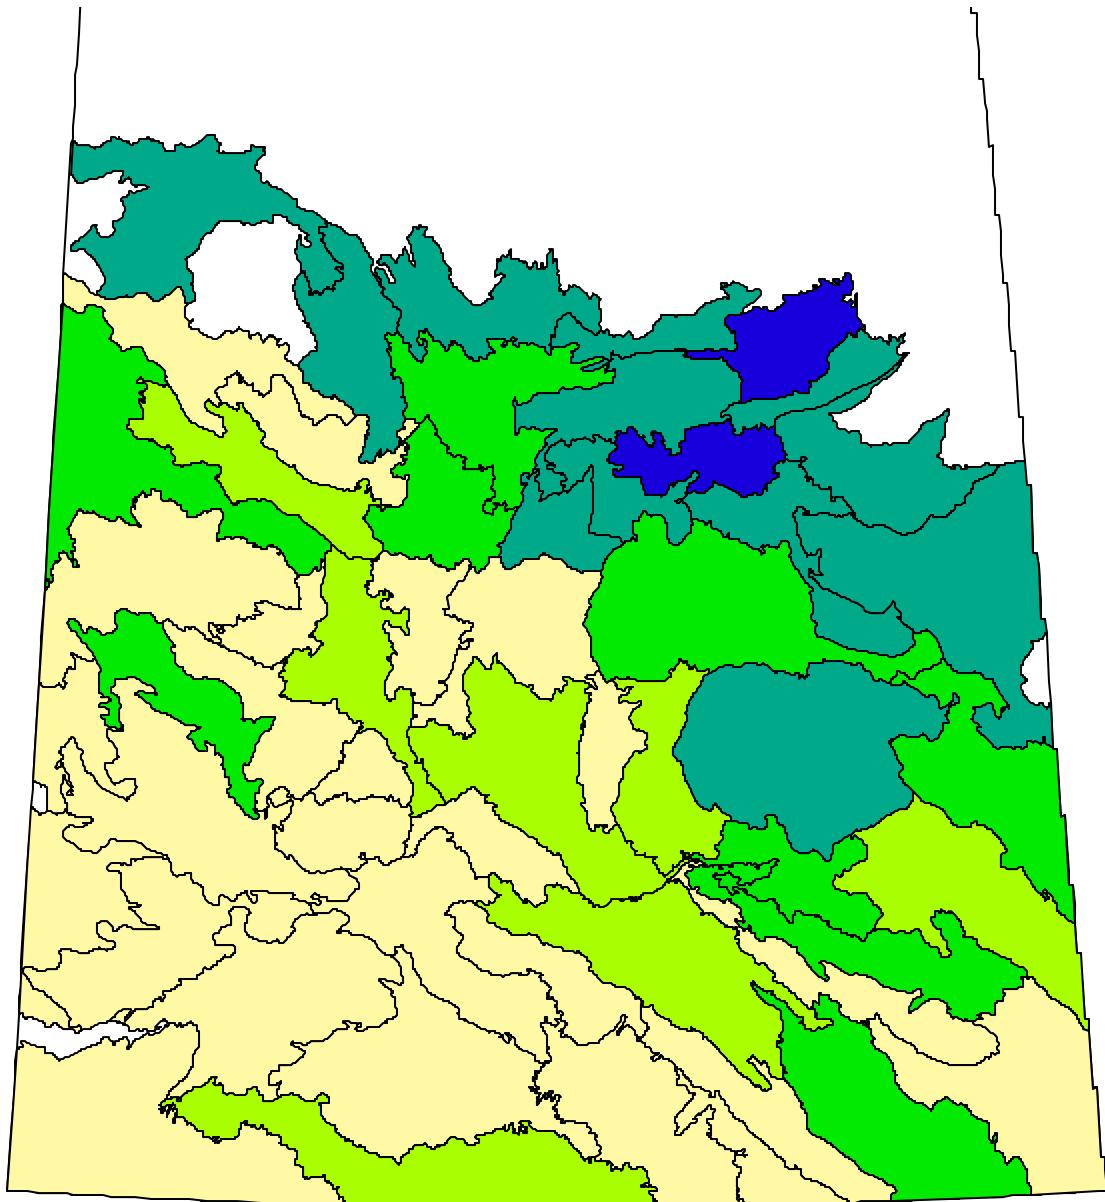

Night-flowering catchfly

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

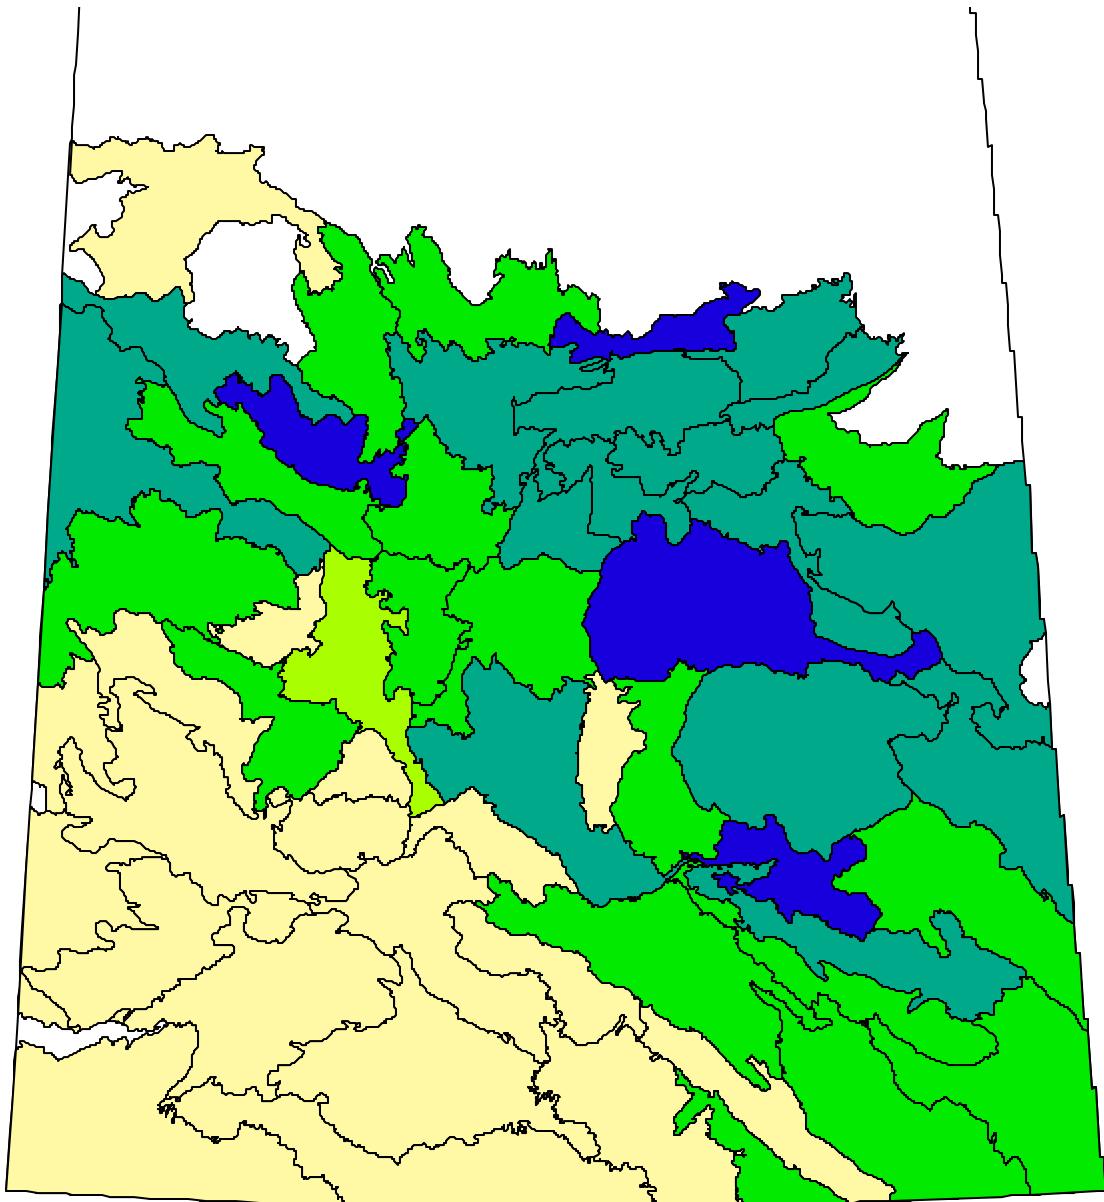

Pale smartweed

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

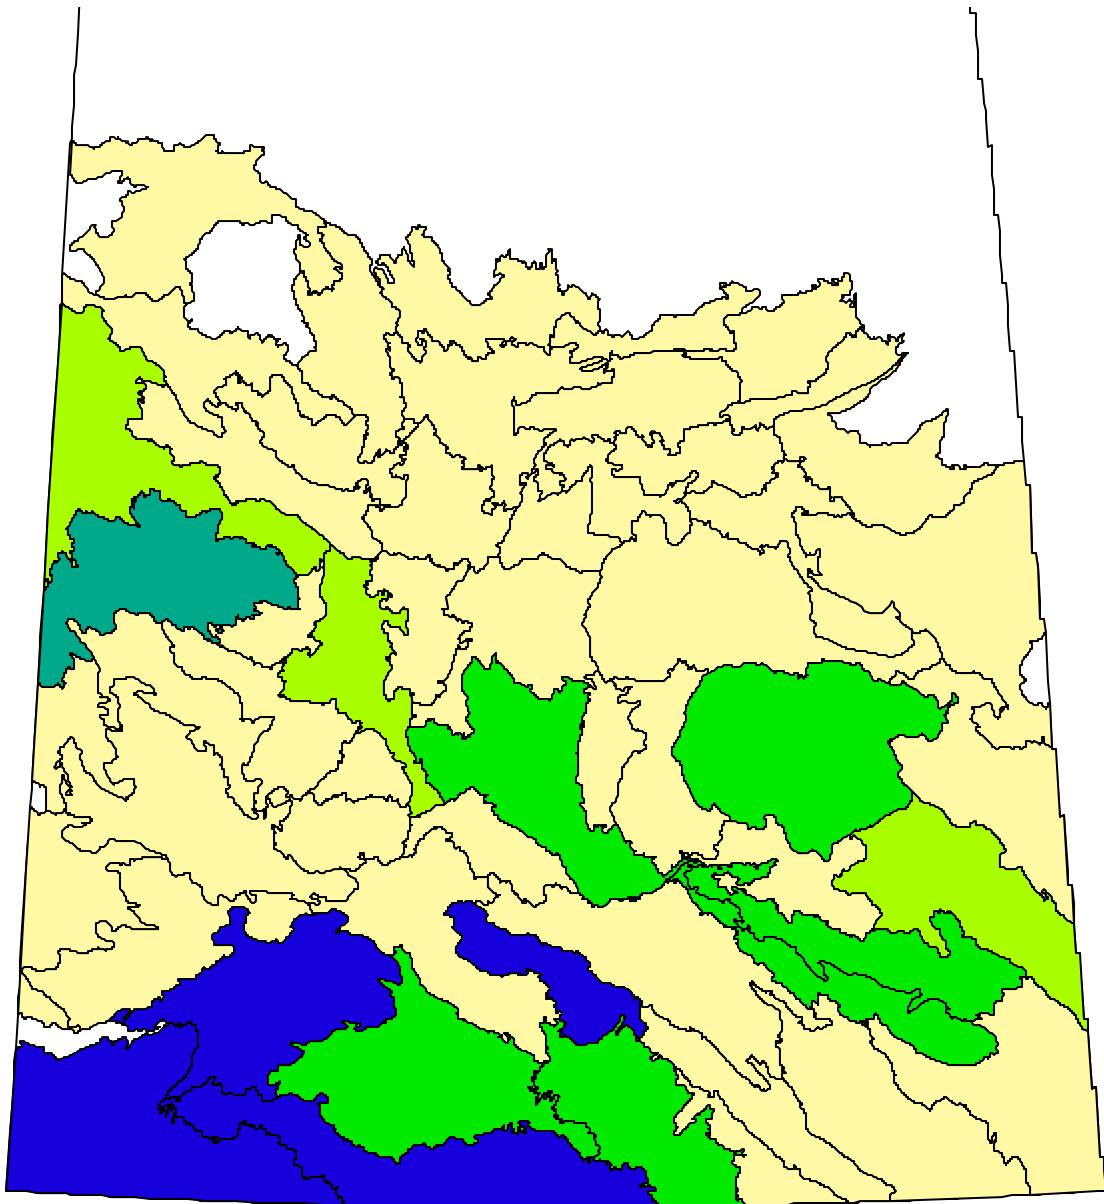

Perennial sow-thistle

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

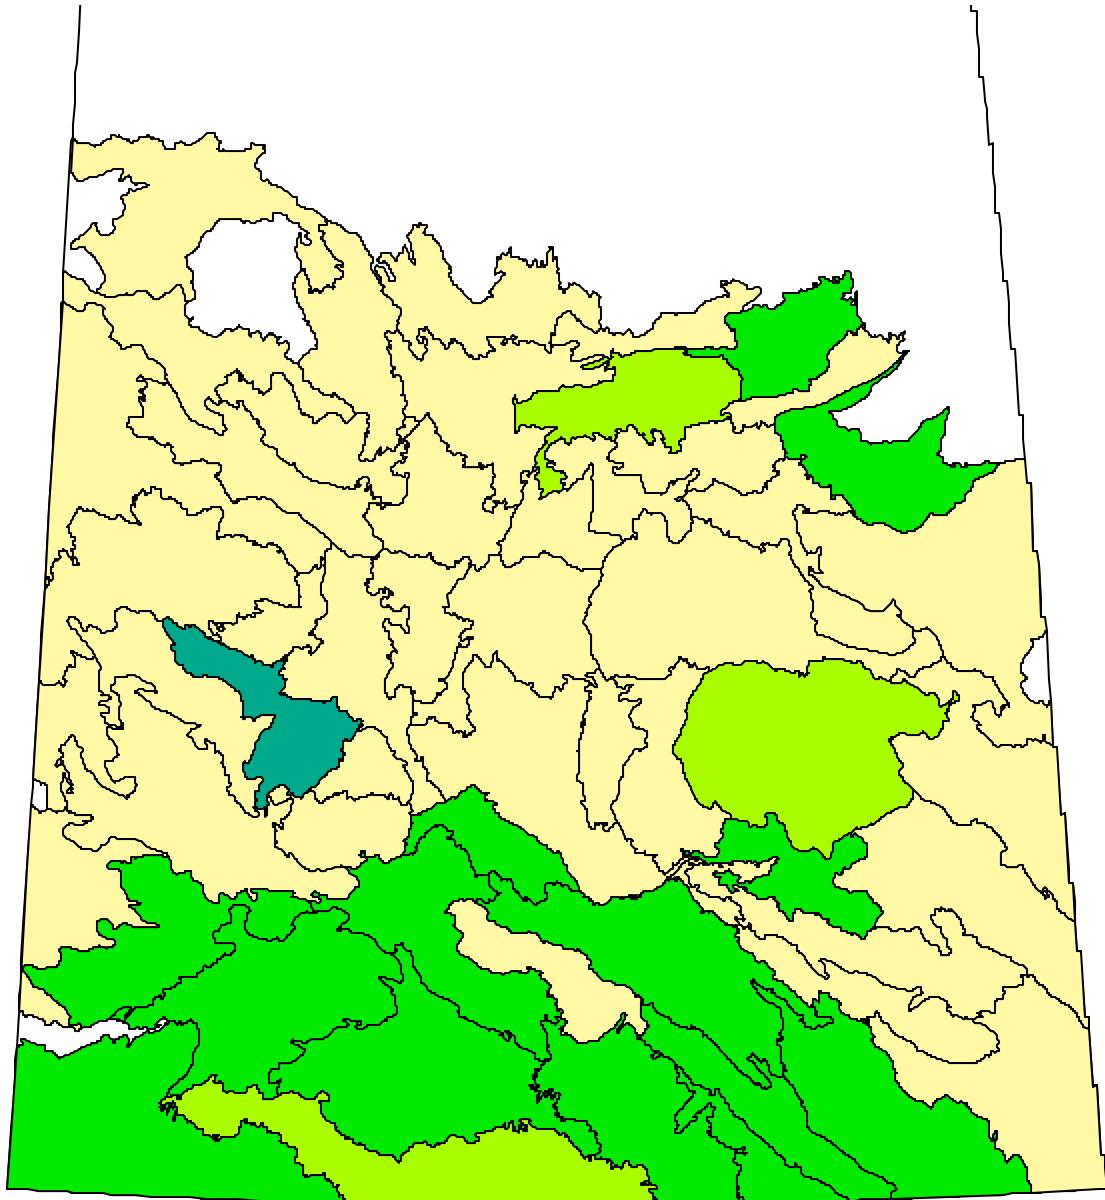

Persian darnel

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

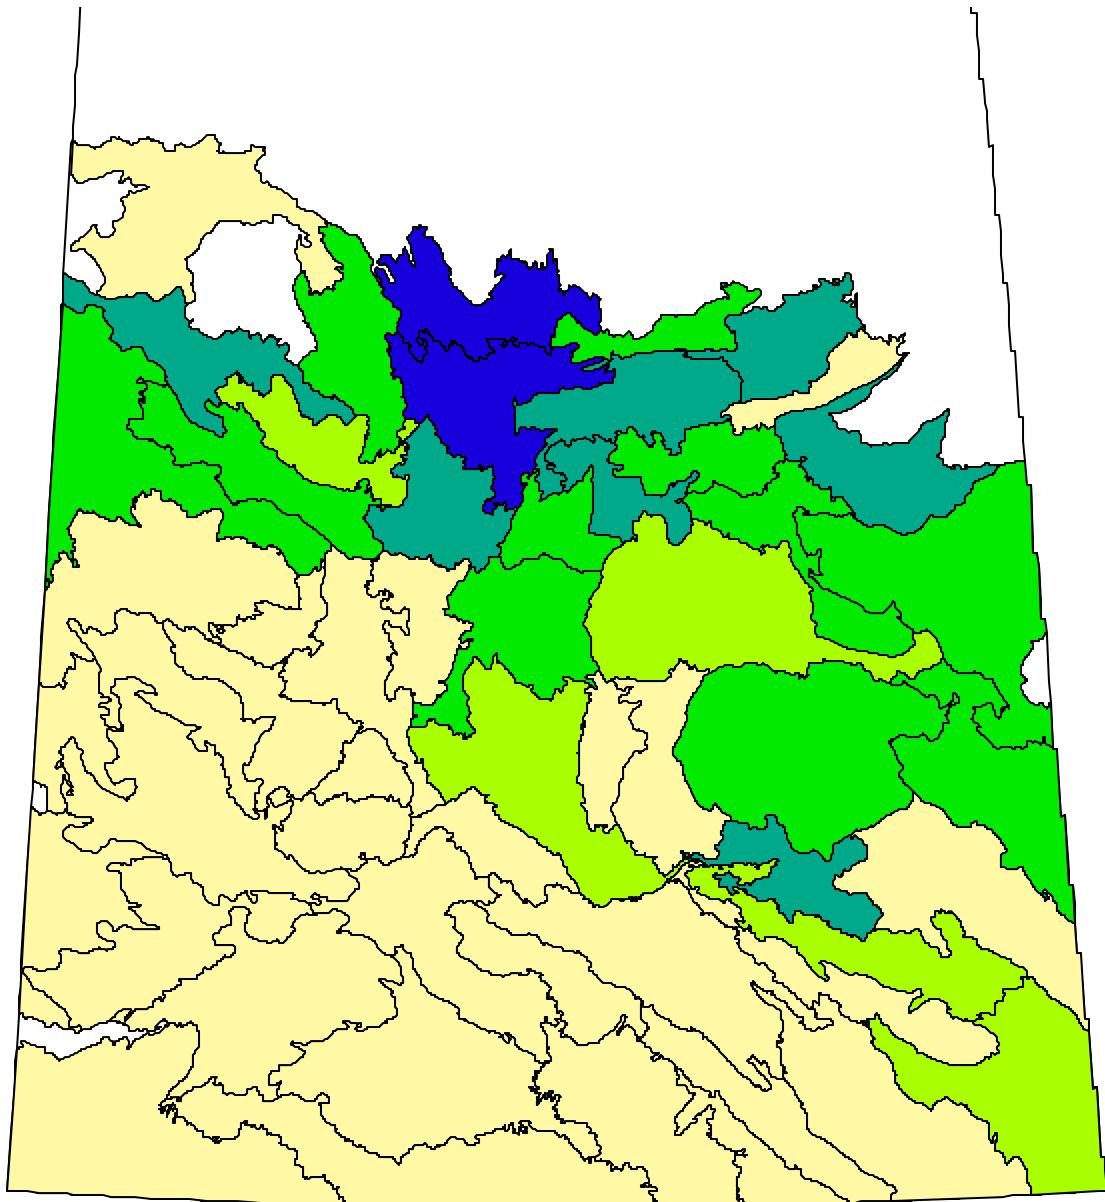

Prickly lettuce

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

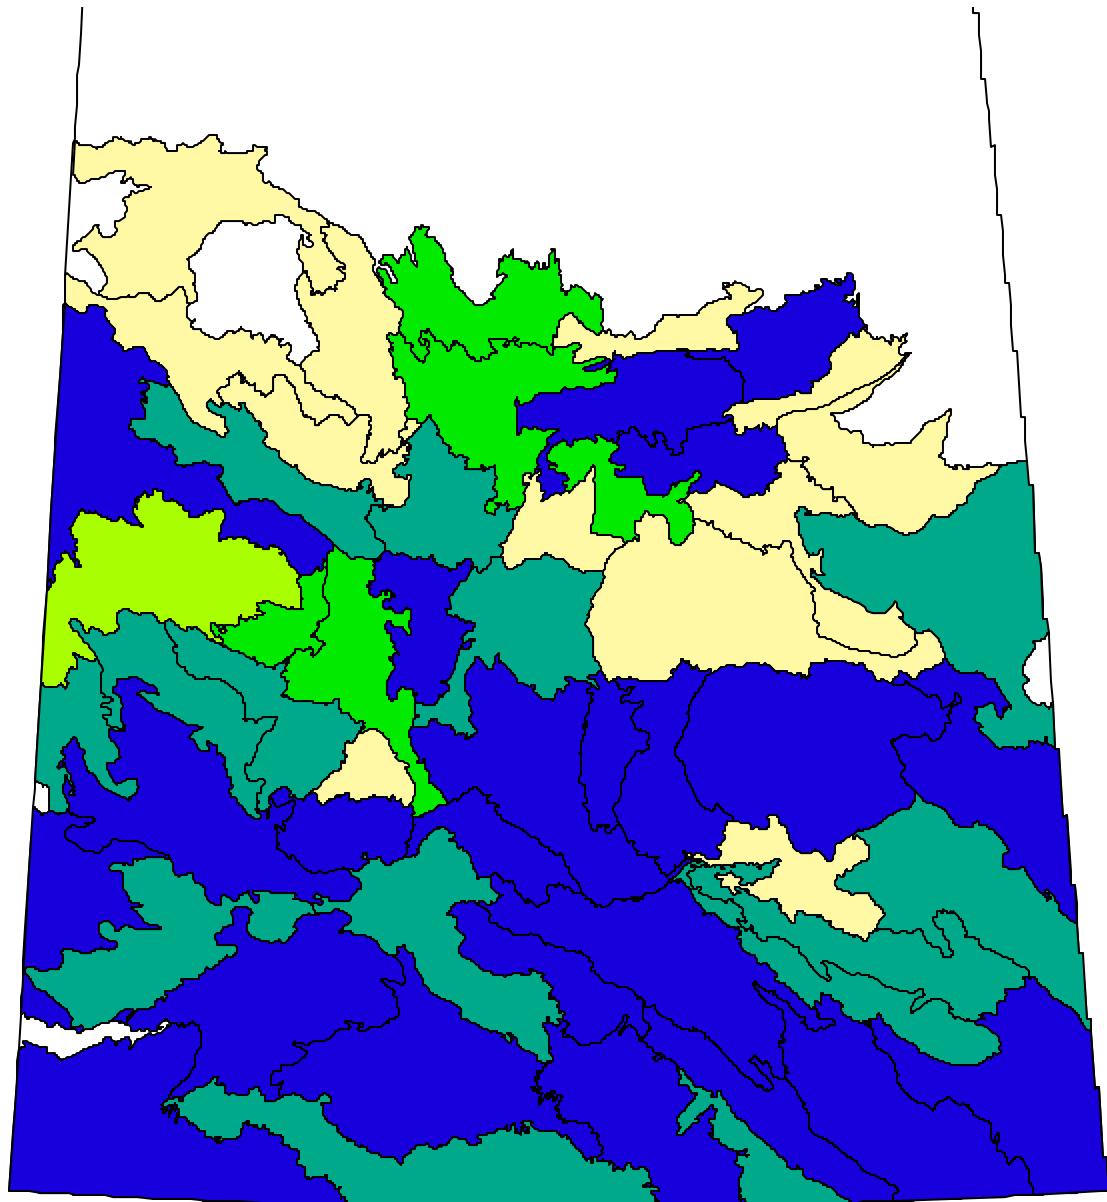

Quack grass

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

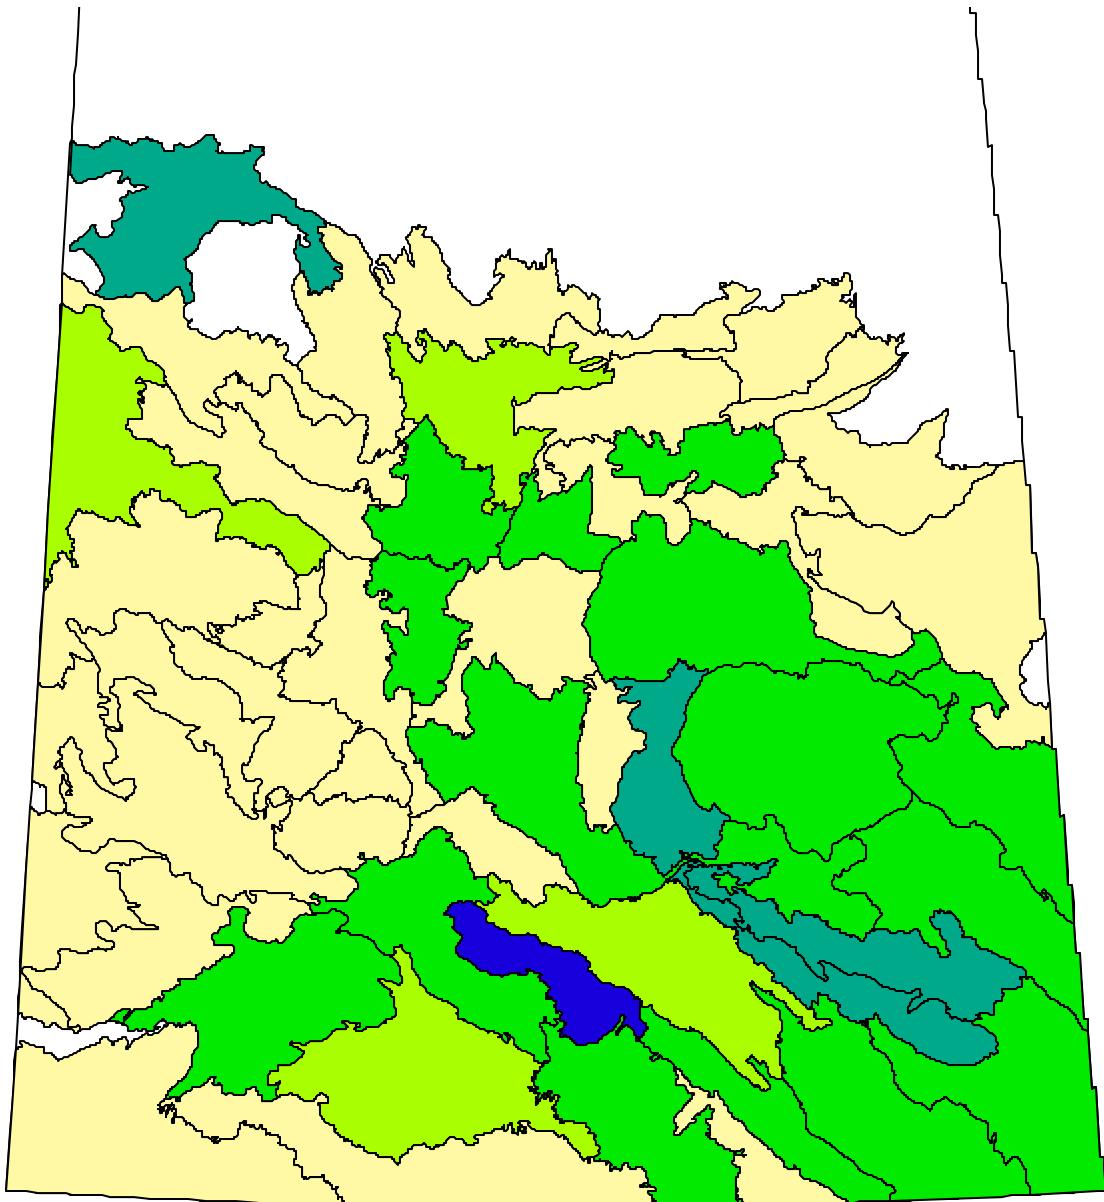

Redroot pigweed

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

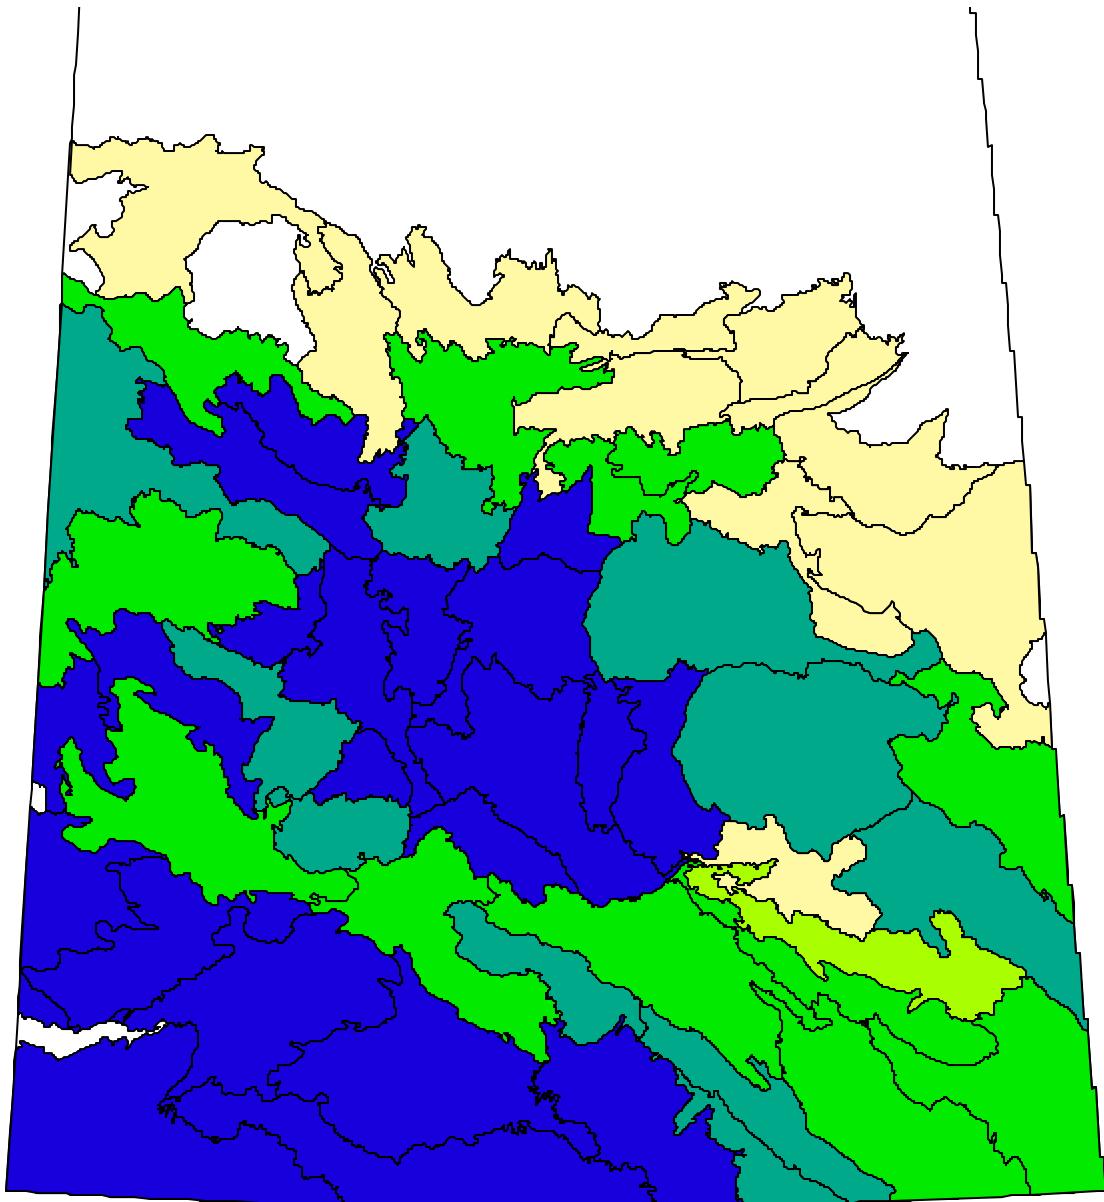

Round-leaved mallow

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

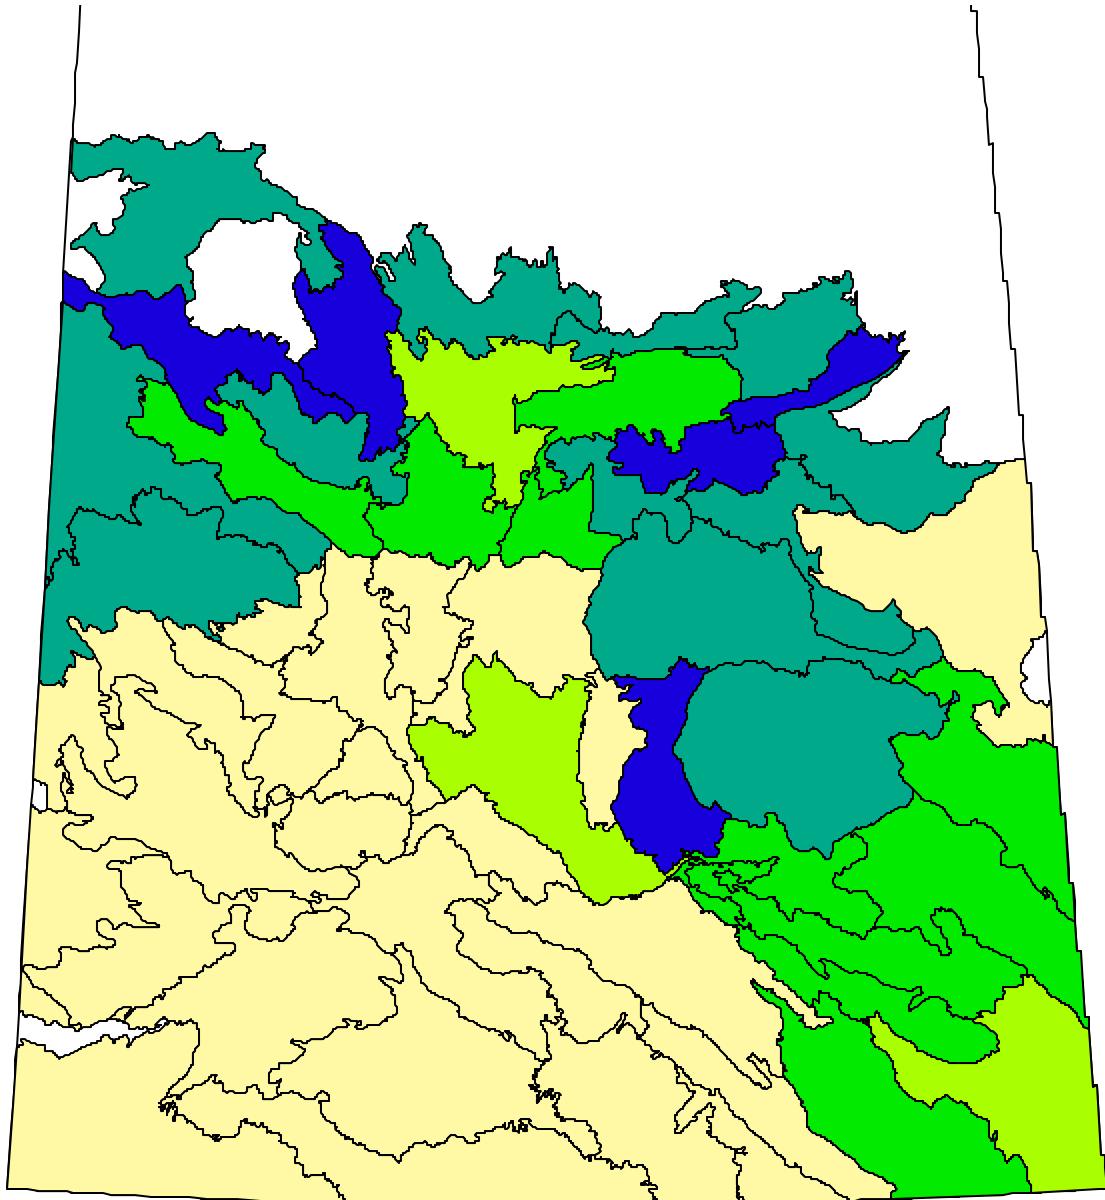

Russian thistle

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

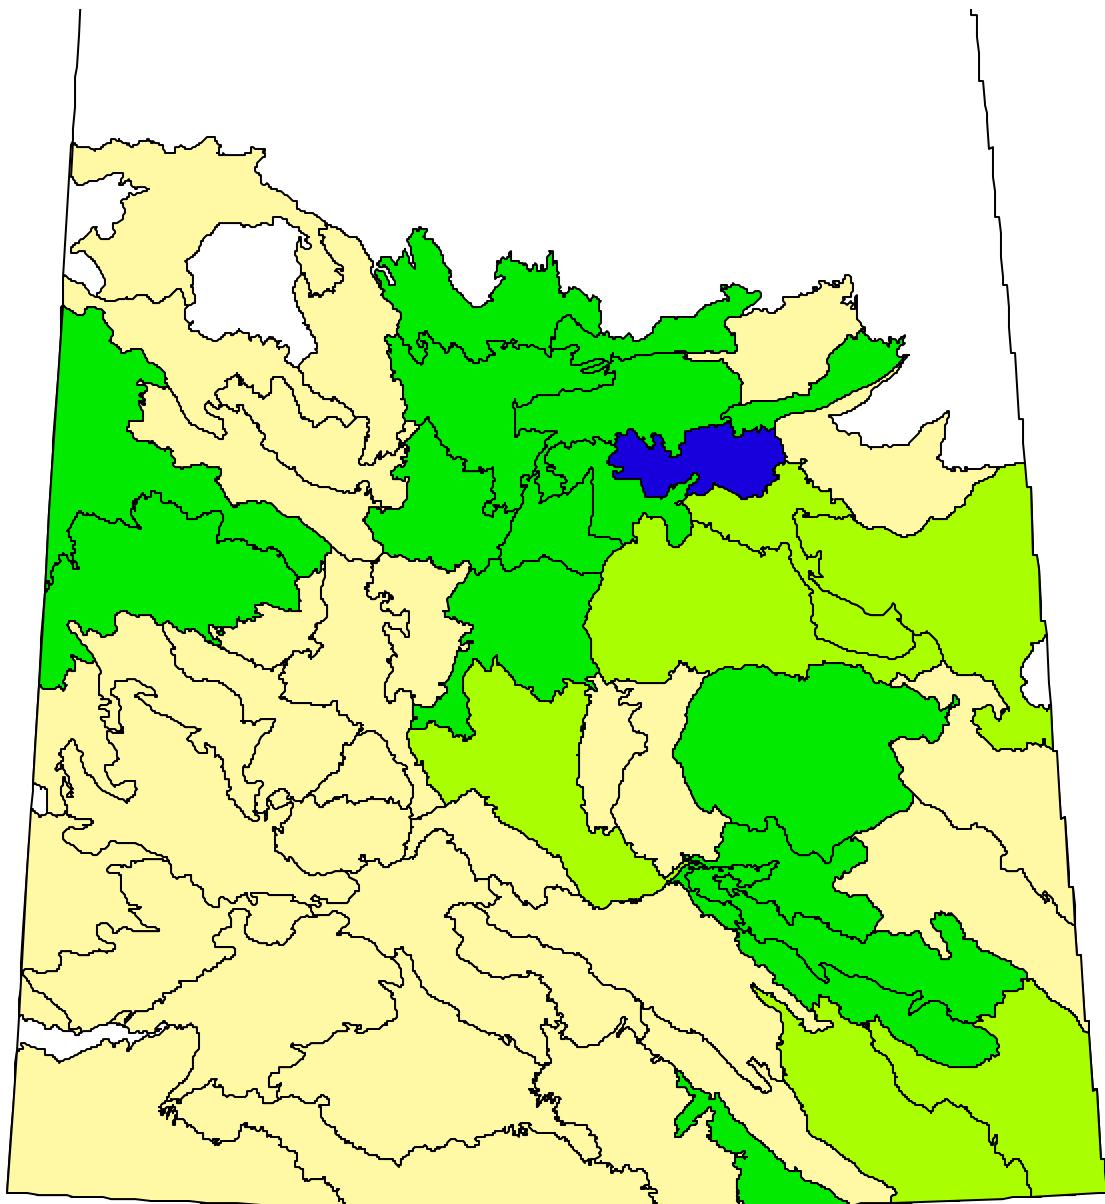

Shepherd's-purse

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

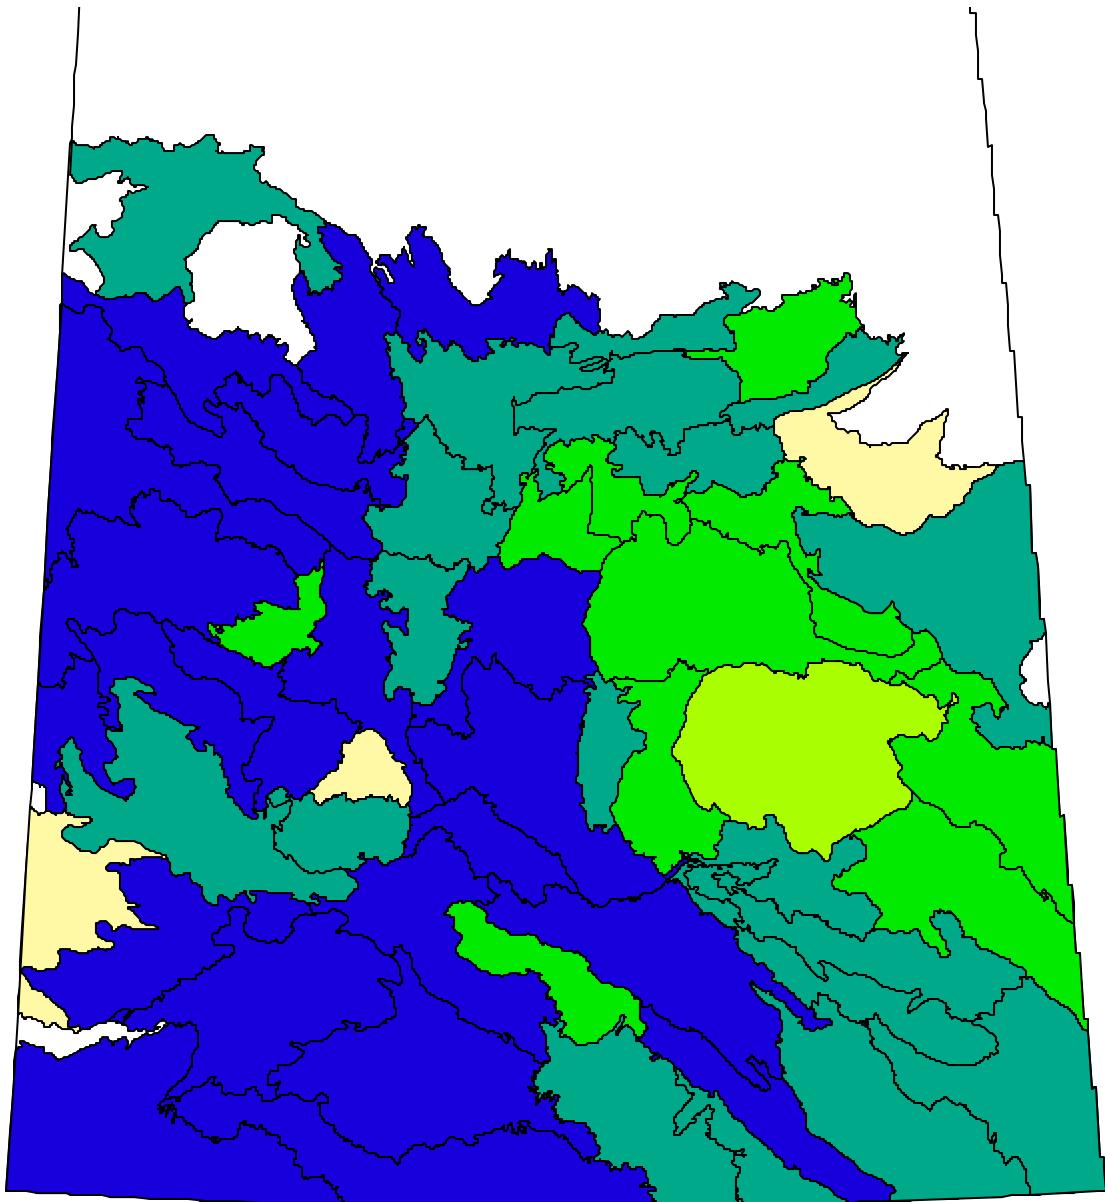

Spiny annual sow-thistle

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

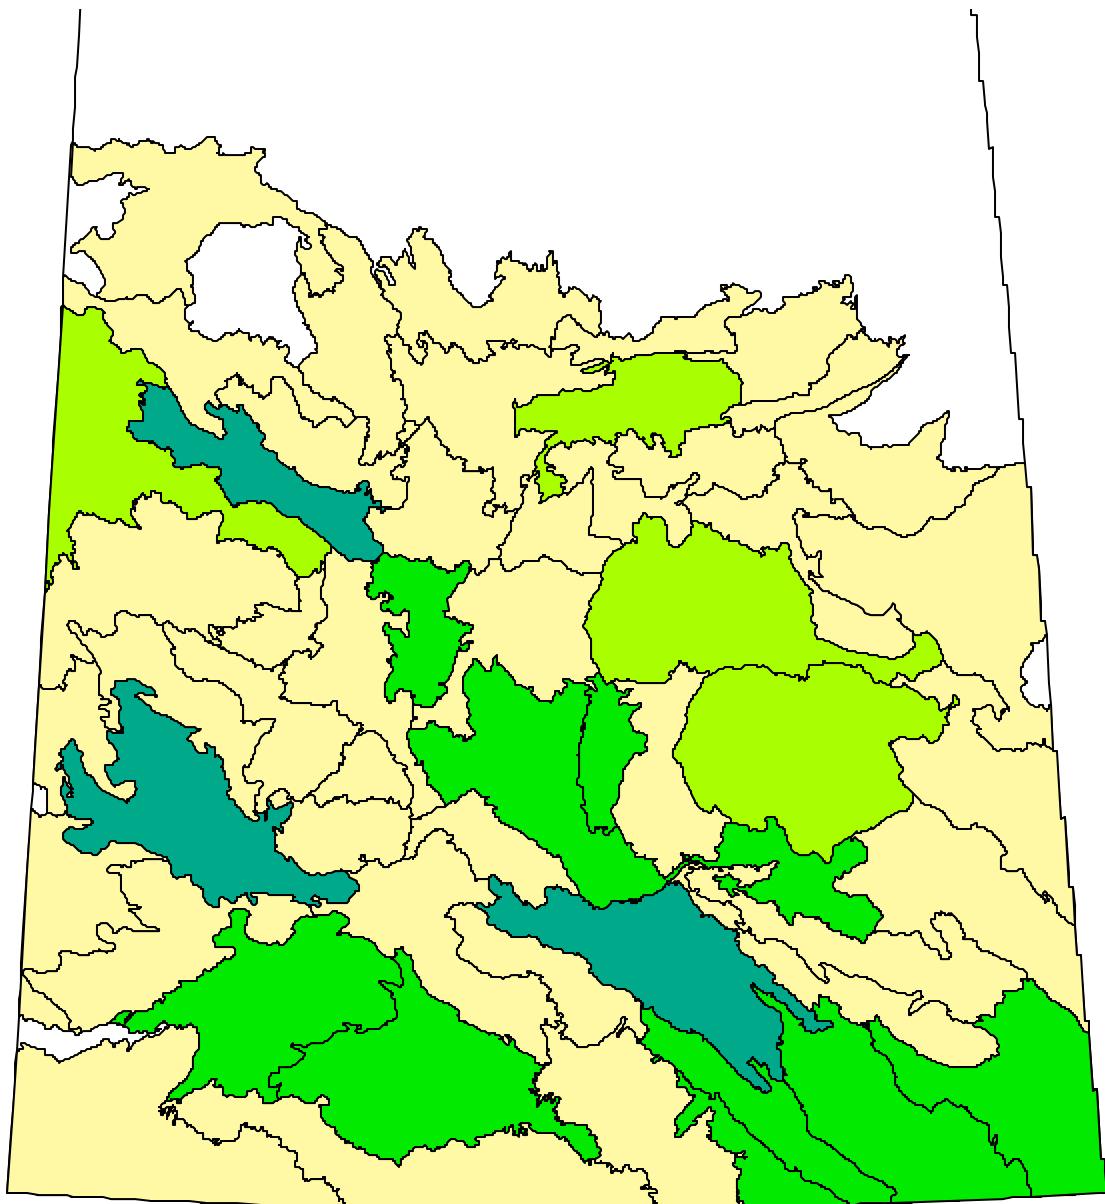

Stinkweed

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

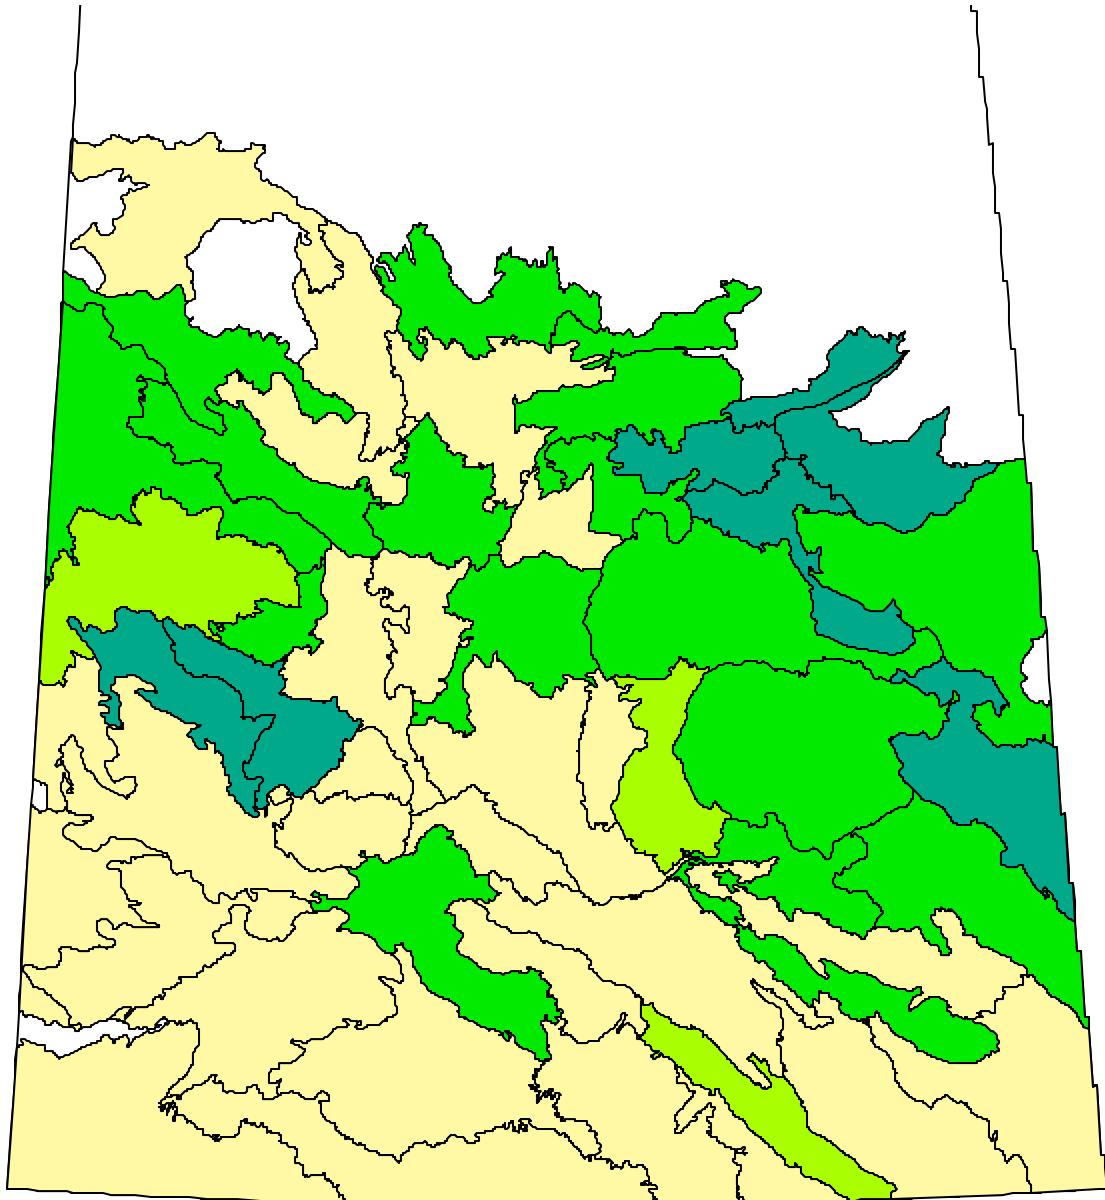

Thyme-leaved spurge

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

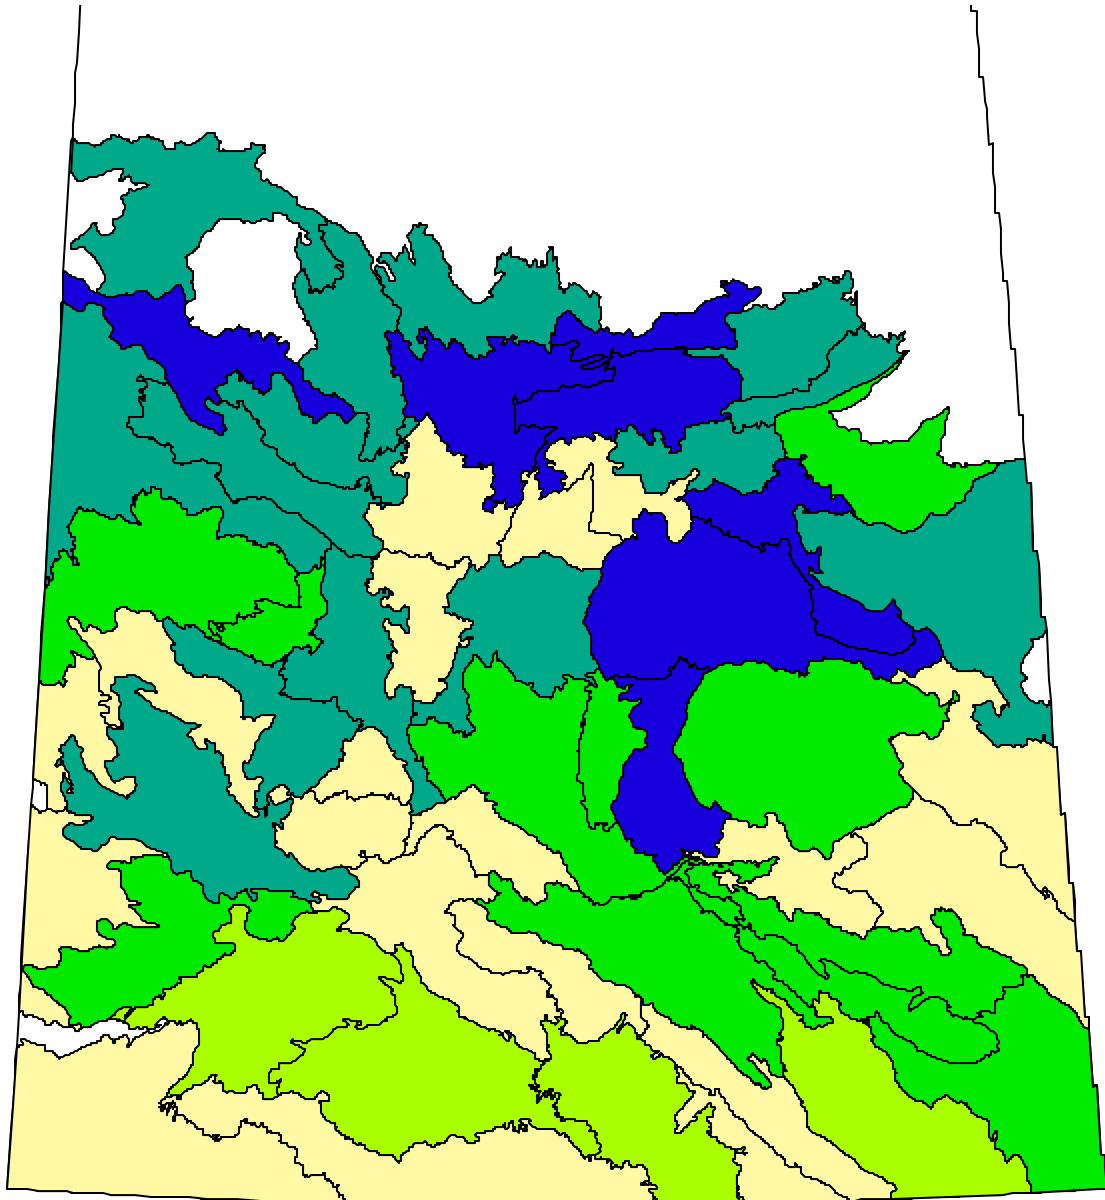

Volunteer barley

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

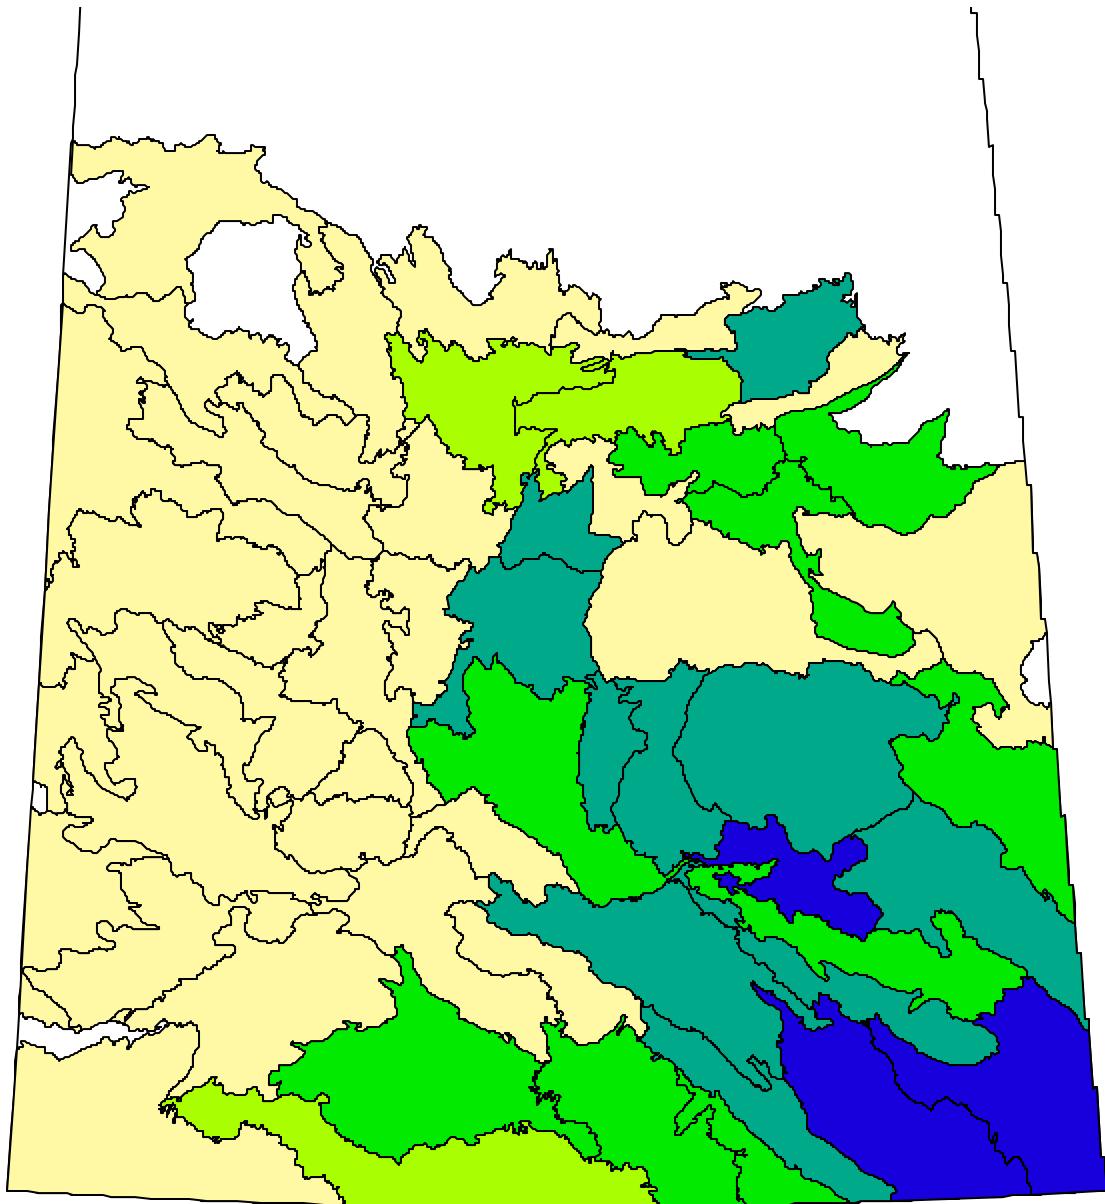

Volunteer canola (Argentine)

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

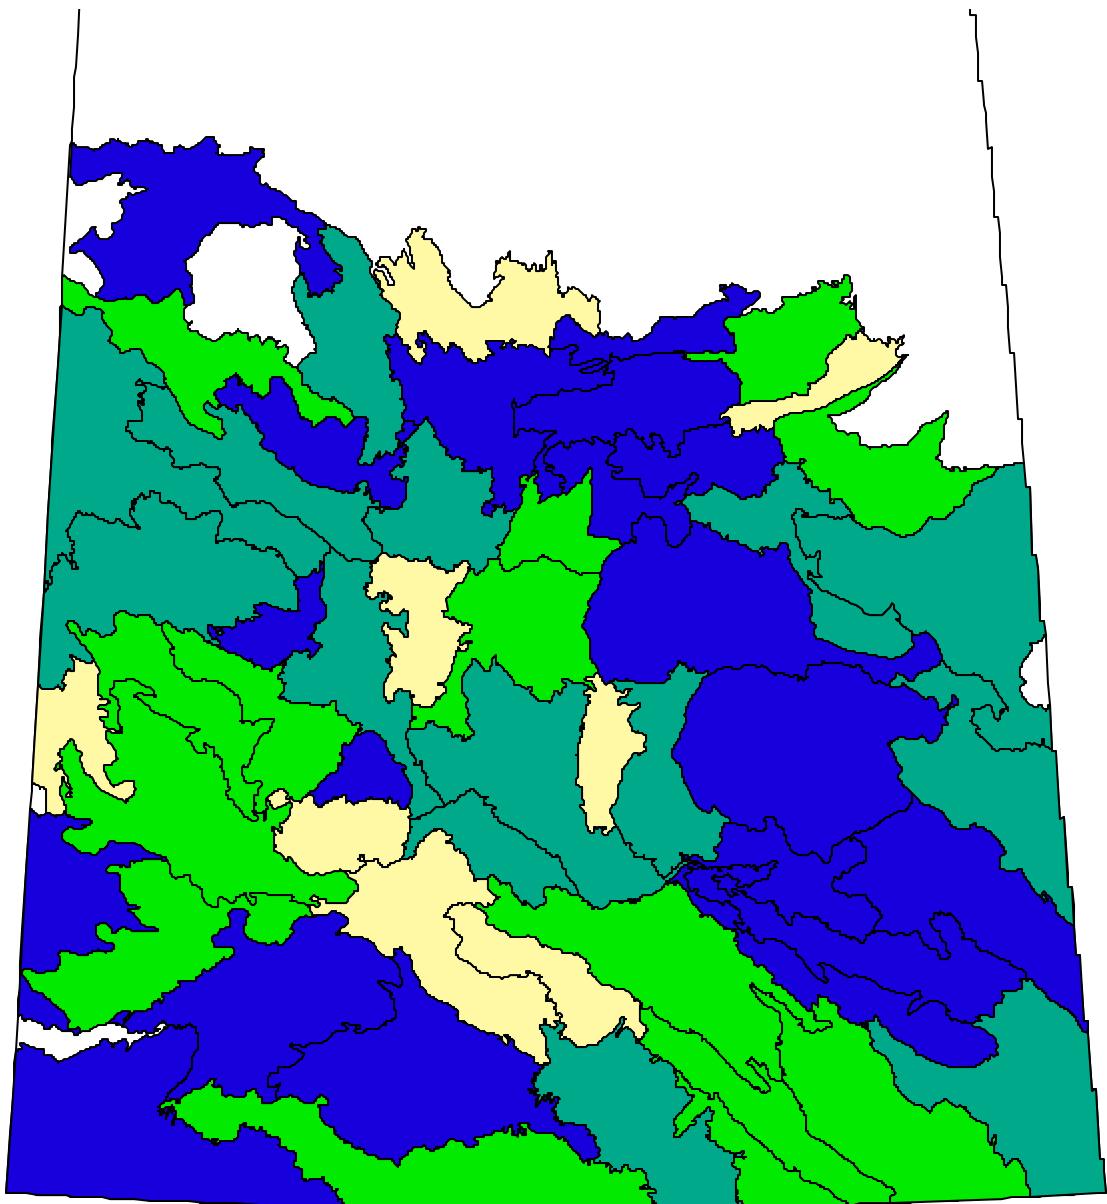

Volunteer flax

Relative Abundance Index

□ Not included	■ 1.1 to 4
■ Absent	■ 4.1 to 10
■ 0.1 to 1	■ More than 10

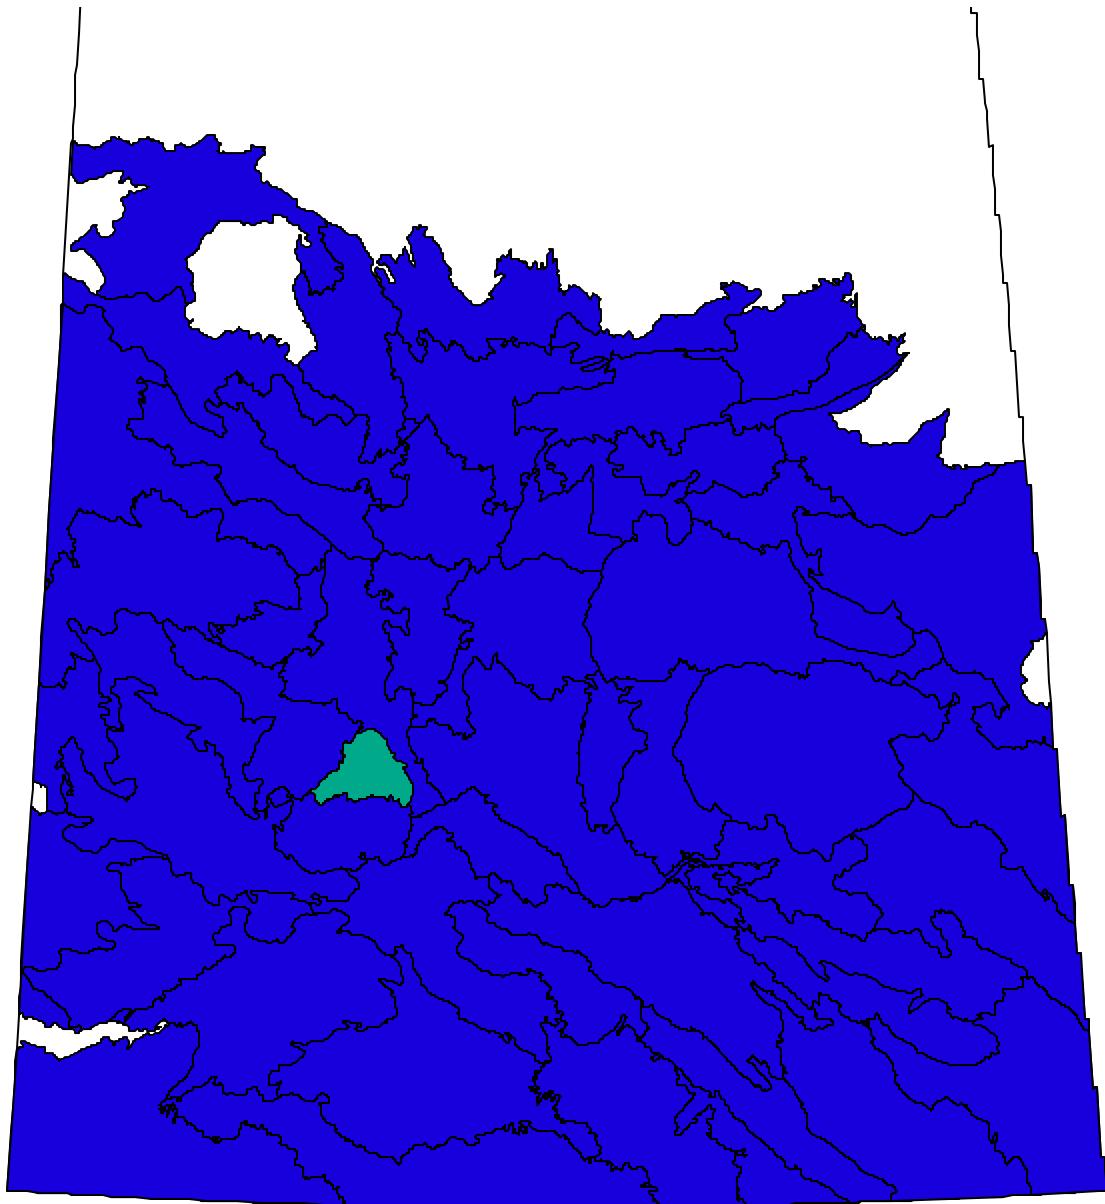

Volunteer wheat/durum

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

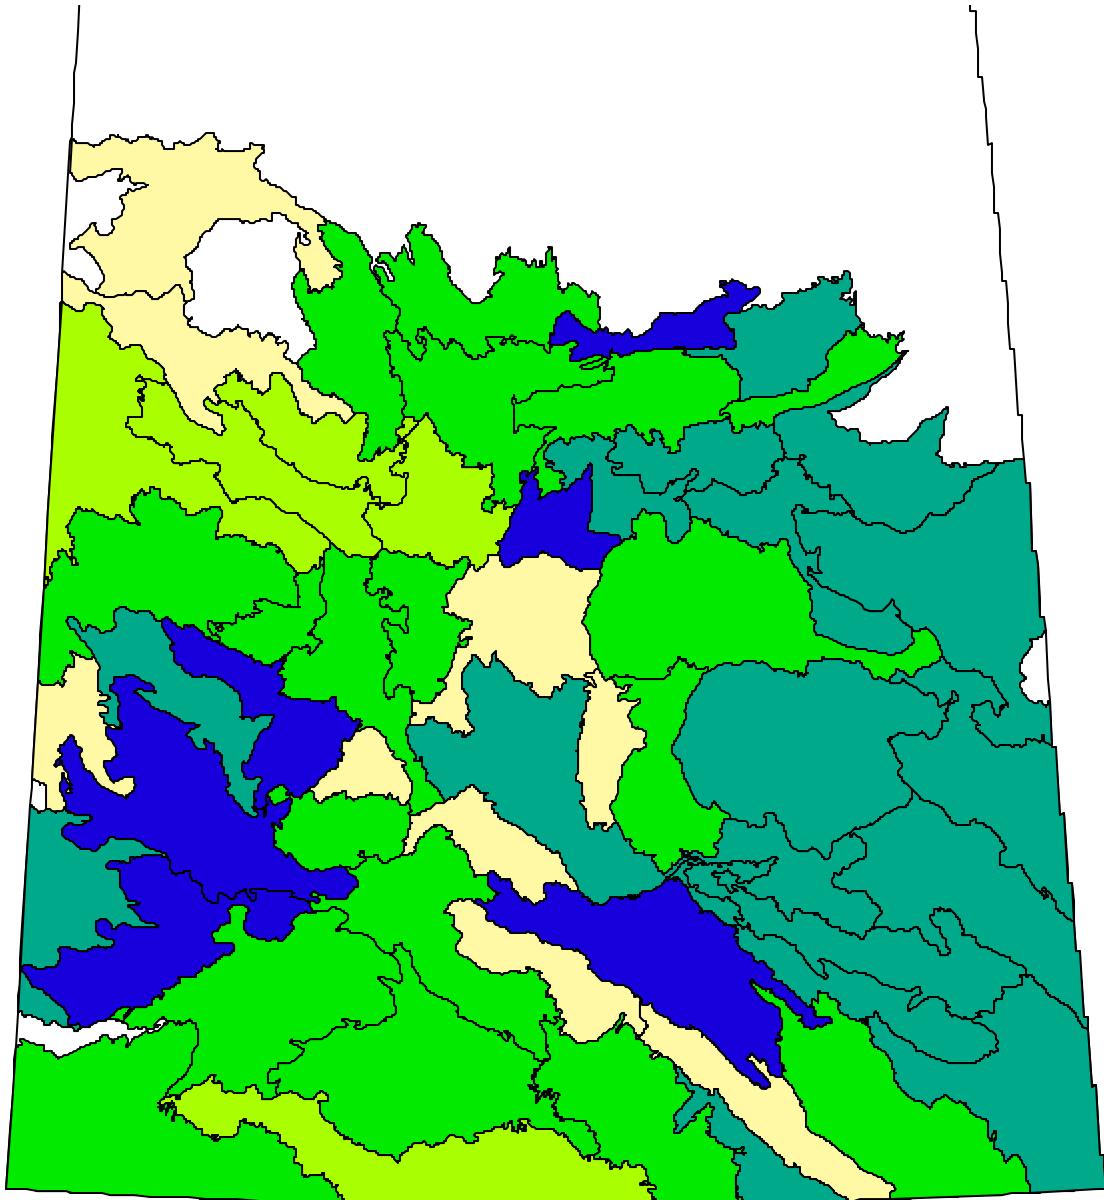

Wild buckwheat

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

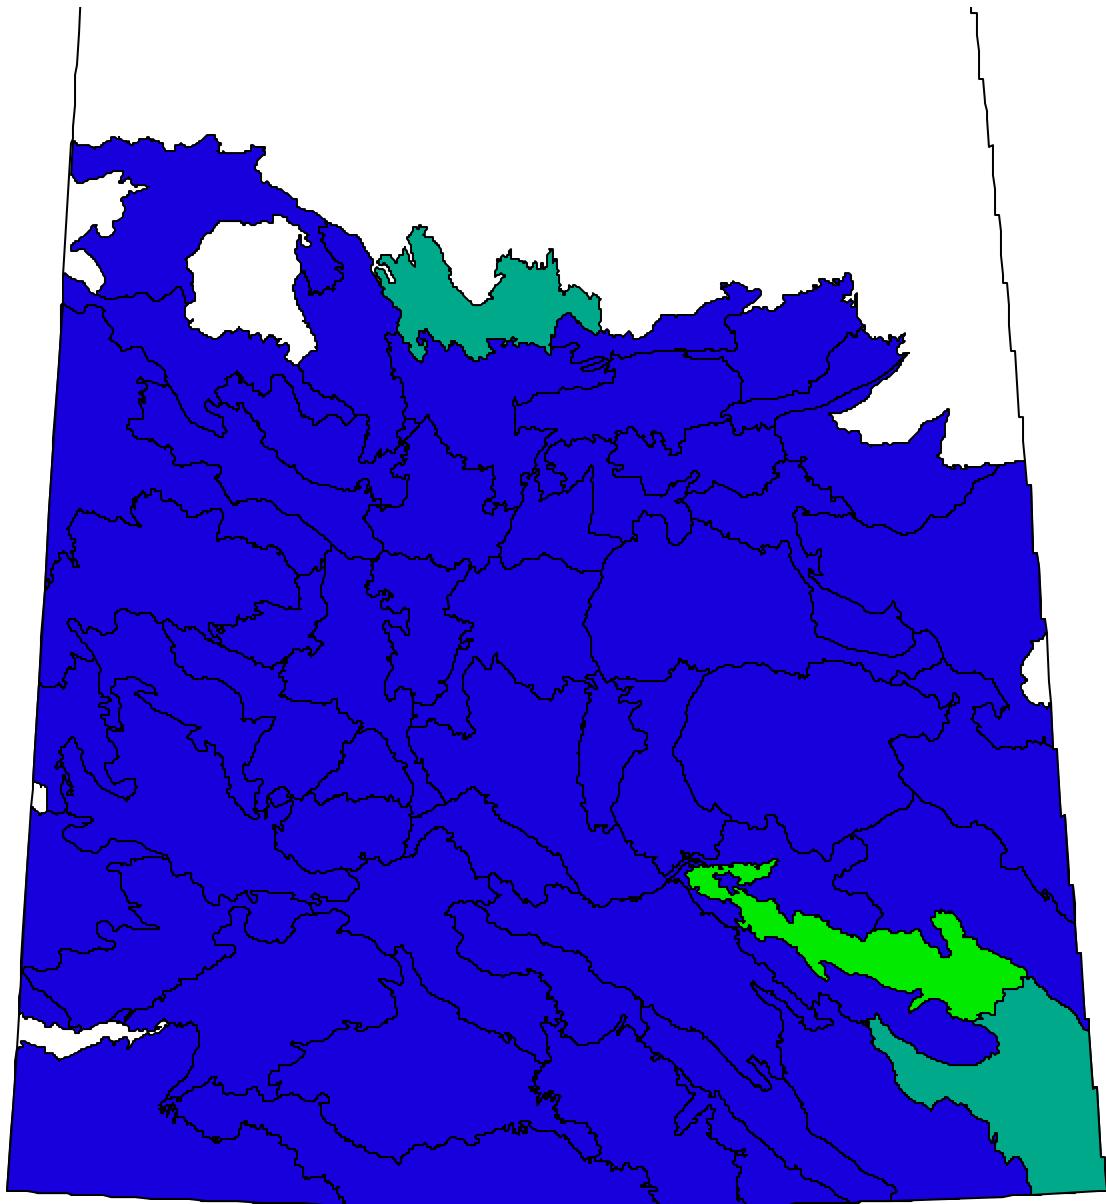

Wild mustard

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |

Wild oats

Relative Abundance Index

- | | |
|----------------|----------------|
| □ Not included | ■ 1.1 to 4 |
| ■ Absent | ■ 4.1 to 10 |
| ■ 0.1 to 1 | ■ More than 10 |
